this book collates past and current research on one of the most promising emerging modalities for breast cancer detection readers will discover how as a standalone technology or in conjunction with another modality microwave imaging has the potential to provide reliable safe and comfortable breast exams at low cost current breast imaging modalities include x ray ultrasound magnetic resonance imaging and positron emission tomography each of these methods suffers from limitations including poor sensitivity or specificity high cost patient discomfort and exposure to potentially harmful ionising radiation microwave breast imaging is based on a contrast in the dielectric properties of breast tissue that exists at microwave frequencies the book begins by considering the anatomy and dielectric properties of the breast contrasting historical and recent studies next radar based breast imaging algorithms are discussed encompassing both early stage artefact removal and data independent and adaptive beamforming algorithms in a similar fashion microwave tomographic reconstruction algorithms are reviewed in the following chapter introducing the reader to both the fundamental and more advanced algorithms apart from imaging the book also reviews research efforts in extracting clinically useful information from the radar target signature of breast tumours which is used to classify tumours as either benign or malignant finally the book concludes by describing the current state of the art in terms of prototype microwave breast imaging systems with a particular emphasis on those which have progressed to the clinical evaluation stage this work is motivated by the fact that breast cancer is one of the leading causes of death amongst women in europe and the us and the second most common cancer in the world today such an important area of research will appeal to many scholars and practitioners p

neuroscience is a rapidly advancing field that seeks to understand the complexities of the human mind and brain one avenue of this research focuses on the detection and segmentation of neural patterns which can provide insights into cognitive functions disease states and treatment effects these techniques demand the synthesis of numerous evolving fields including machine learning artificial intelligence and medical imaging despite considerable progress significant challenges remain requiring innovative solutions leveraging cutting edge technologies this research topic aims to address the ongoing challenge of advancing pattern detection and segmentation techniques in neuroscience as the complexity of neuronal data increases a growing necessity for novel algorithms and machine learning techniques is evident this topic seeks to bring together researchers from various fields to share their groundbreaking methods and innovative results in detecting and segmenting neural patterns the ultimate goal is to refine our understanding of neural patterns enhance modeling capabilities and establish a foundation for future neuroscience research and clinical applications this research topic invites contributions addressing but not limited to the following themes advances in detecting brain patterns focuses on new ai algorithms

that drive our understanding of brain patterns methods of applying segmentation discusses improvement and challenges in data segmentation in neuroimaging ai s role in identifying neural patterns showcases how ai and machine learning contribute to identifying brain patterns neuroimaging tools and techniques explores applications of fmri ct scans dti and combination methods in studying brain patterns insights from pattern detection highlights practical applications of pattern detection aiding in understanding cognitive processes and early detection of neurological diseases real life implications and applications details the practical uses of advanced techniques in detecting neurological diseases and personalizing treatment plans please be aware that manuscripts emphasizing data synthesis neuroimaging methods and the integration of informatics to analyze and interpret complex neural data must be submitted to frontiers in neuroinformatics while those focusing on advanced algorithms ai techniques and machine learning applications specifically tailored for pattern detection and segmentation in neuroscience should be directed towards submission to frontiers in computational neuroscience we welcome various manuscripts including original research articles reviews method articles clinical trial papers and perspectives contributions discussing advancements in brain pattern detection and segmentation techniques their transformative impact across diverse research fields and potential challenges are particularly encouraged under the overarching umbrella of neuroscience we seek interdisciplinary collaborations to present an innovative snapshot of neuro detection s ongoing progress and its repercussions on neuroscience research

this book presents cutting edge research on various ways to bridge the semantic gap in image and video analysis the respective chapters address different stages of image processing revealing that the first step is a feature extraction the second is a segmentation process the third is object recognition and the fourth and last involve the semantic interpretation of the image the semantic gap is a challenging area of research and describes the difference between low level features extracted from the image and the high level semantic meanings that people can derive from the image the result greatly depends on lower level vision techniques such as feature selection segmentation object recognition and so on the use of deep models has freed humans from manually selecting and extracting the set of features deep learning does this automatically developing more abstract features at the successive levels the book offers a valuable resource for researchers practitioners students and professors in computer engineering computer science and related fields whose work involves images video analysis image interpretation and so on
