this book originates from the lectures given at the international conference theory and practice of geometric modeling blaubeuren frg october 3 7 1988 that brought together leading experts from universities system developers and system users to discuss new concepts and future trends in geometric modeling the book covers a variety of topics on an advanced level and is organized as follows part a contains new algorithms and techniques for modeling objects that are bounded by free form surfaces part b focuses on surface surface intersections new types of blending surfaces and speed ups for ray tracing part c contains some new geometric tools part d discusses different representation schemes in solid modeling conversions between these different schemes and some applications part e covers some issues of product modeling automatic tolerancing high level specification of solid models constraints features and the need for better user interfaces

this volume grew out of two ams conferences held at columbia university new york ny and the stevens institute of technology hoboken nj and presents articles on a wide variety of topics in group theory readers will find a variety of contributions including a collection of over 170 open problems in combinatorial group theory three excellent survey papers on boundaries of hyperbolic groups on fixed points of free group automorphisms and on groups of automorphisms of compactriemann surfaces and several original research papers that represent the diversity of current trends in combinatorial and geometric group theory the book is an excellent reference source for graduate students and research mathematicians interested in various aspects of group theory

geometric data analysis designates the approach of multivariate statistics that conceptualizes the set of observations as a euclidean cloud of points combinatorial inference in geometric data analysis gives an overview of multidimensional statistical inference methods applicable to clouds of points that make no assumption on the process of generating data or distributions and that are not based on random modelling but on permutation procedures recasting in a combinatorial framework it focuses particularly on the comparison of a group of observations to a reference population combinatorial test or to a reference value of a location parameter geometric test and on problems of homogeneity that is the comparison of several groups for two basic designs these methods involve the use of combinatorial procedures to build a reference set in which we place the data the chosen test statistics lead to original extensions such as the geometric interpretation of the observed level and the construction of a compatibility region features defines precisely the object under study in the context of multidimensional procedures that is clouds of points presents combinatorial tests and related computations with r and coheris spad software includes four original case studies to illustrate application of the tests includes necessary mathematical background to ensure it is self contained this book is suitable for researchers and students of multivariate statistics as well as applied researchers of various scientific disciplines it could be used for a specialized course taught at either master or phd level

annotation the 39 papers anticipate the first in a series of biennial international conferences on solid modeling shape representation and geometric computation all of which are procedures important in a wide range of disciplines including computer graphics computer aided design computer vision medical imaging and scientific computation the largest number of them address various ideas in curve and surface modeling from long standing issues such as interpolation and approximation to recently popular ideas such as polyhedral and subdivision methods and more specific areas such as blending deformations implicitization and parametrized design attracting the second most attention is solid modeling from such perspectives as inputting models from sketches and from scanned data subdivision modeling and trimmed patches discussions of applications include polygon mesh refinement in computer graphs modeling the draping of cloth generating moulds and watermarking polygon meshes for security there is no subject index annotation copyrighted by book news inc portland or
