this forward thinking volume grapples with critical questions surrounding the mechanisms underlying mental disorders and the systems used for classifying them edited and written by leading international authorities many of whom are actively involved with the development of dsm v and icd 11 the book integrates biological and psychosocial perspectives it provides balanced analyses of such issues as the role of social context and culture in psychopathology and the pros and cons of categorical versus dimensional approaches to diagnosis cutting edge diagnostic instruments and research methods are reviewed throughout contributors highlight the implications of current theoretical and empirical advances for understanding real world clinical problems and developing more effective treatments

the relatively frequent occurrence of rapid onset and very brief but often florid psychotic states with periodic recurrence alongside relatively low rates of ptsd and chronic psychosis were unexpected findings from the 2004 east timor mental health study conducted in the context of the country s recently won independence and in the wake of the atrocities endured in the protracted fight for sovereignty further unanticipated was

the frequent association of recurrence with the time of the new moon fulan lotuk and other times or places of sacred lulik or associated cultural significance the perceived violation of culturally sacrosanct lulik obligations often also appeared to foreshadow the initial onset of such patterns of distress significant episodes of trauma and loss appeared a hidden feature of affected individuals histories which we argue have become symbolically entwined with local cultural understandings of ritual obligation sacredness and taboo this volume develops a dynamic but contextualized multi level formulation of psychosis and psychotic symptoms able to incorporate a range of factors from the biological through the sociocultural to the political the work is truly interdisciplinary drawing on both the quantitative and qualitative findings of our own study but further supported through local ethnography and broader anthropological enquiry into the outcomes of psychosis in non western settings psychoanalysis and psychoanalytic anthropology evidence and theory exploring links between trauma dissociation and psychosis and novel culturally adaptable psychosocial focused interventions for psychosis we situate both evidence and theorising in wider epistemological and political context including in relation to the movement for global mental health culturally patterned presentations of brief remitting relapsing psychosis are ultimately conceived as the trade off between competing fragmentary and synthetic forces the former in part secondary to the lasting and deleterious effects of overwhelming loss trauma and adversity the latter emboldened by cultural meaning and social response in the context of broad ecological pressures demanding survival and resilience

as scientists or clinicians we all have an implicit theory about how the mind relates to the nervous system which infuses our research and practice this theory entails what has been traditionally known as the mind body problem intrinsically connected to the question of potentials and constraints of human and conscious artificial life it still represents an open and highly debated philosophical and empirical question the common assumption for many cognitive neuropsychologists and neuropsychiatrists is that by looking at the anatomical brain function or malfunction it is possible to predict the behavioral experience of individuals this view often called reductionism has dominated the research trajectories in neuroscience and psychiatry in the past decades

regulatory problems defined as excessive crying sleeping or feeding problems are among the most common concerns of parents with children 0 5 years old these problems are typically understood within the context of the parent child relationship however the complex underlying mechanisms that explain the occurrence and continuation as well as long term outcomes of regulatory problems are still poorly understood despite some promising treatment options important knowledge gaps remain to be addressed which will inform evidence based practice for services of children aged 0 5 with this research topic we aim to bring together research from different countries and from multidisciplinary research backgrounds on the topic of regulatory problems and disorders we particularly encourage research that focuses on observed parent child interactions in relation to regulatory problems we view regulatory problems as a transdiagnostic biopsychosocial concept covering excessive crying sleeping and or feeding and eating problems however studies with a focus on any of these problems are also encouraged

this book outlines both the theory and application of regulation intervention strategies for children with complex trauma history national statistics identify that 1 7 children in the united states are subjected to child abuse or neglect the age group with the highest reported incidences are in the 1 3 year old age group the primary perpetrators of this abuse are the child s caregivers this age is closely associated with the critical period of development in the areas of the brain the child s physiology and their social emotional well being when primary attachment is disrupted delays and disruptions across many domains occur when the perpetrator of their trauma is the same person who should be ensuring their safety a child develops behaviors in an attempt to make sense of their world the behaviors serve a purpose behavioral approaches which rely on positive and negative consequences do not adequately address the cause of the behavior and are therefore ineffective other existing trauma interventions rely on the individual to cognitively process information however when dysregulated retrieval of information from the frontal lobe of the brain is not physiologically possible all these approaches also intervene on the assumption that the child knows what normal regulation feels like most

of these children however have only known chaos and fear novelty this attachment based intervention model incorporates neurological physiological observational and practical regulation intervention strategies for anyone working with children with complex trauma history it is able to be applied in home school community and in therapy environments when a child feels regulated and safe the effectiveness of the child's trauma treatment can be enhanced

research on visual perception in schizophrenia has a long history however it is only recently that it has been included in mainstream efforts to understand the cognitive neuroscience of the disorder and to assist with biomarker and treatment development e.g. the nimh cntrics and rdoc initiatives advances in our understanding of visual disturbances in schizophrenia can tell us about both specific computational and neurobiological abnormalities and about the widespread computational and neurobiological abnormalities in the illness of which visual disturbances constitute well studied replicable low level examples importantly far from being a passive sensory registration process visual perception is active inferential and hypothesis generating and therefore can provide excellent examples of breakdowns in general brain functions in schizophrenia despite progress made in understanding visual processing disturbances in schizophrenia many challenges exist and many unexplored areas are in need of examination for example the directional relationships between perceptual and cognitive disturbances e.g. in attention memory executive function predictive coding remain unclear in many cases as do links with symptoms including visual hallucinations the effect of specific visual disturbances on multisensory integration in schizophrenia has also not been explored in addition few studies of vision in schizophrenia have used naturalistic stimuli including real world objects and almost no studies have examined processing during interaction with objects or visual exploration which can provide important data on functioning of the perception for action pathway relatedly studies of visual processing in schizophrenia have also not been conducted within contexts that include emotional stimulation and the presence of reinforcers characteristics of many real world situations and the consequences of this are likely to be an incomplete view of how and when perception is abnormal in the condition an additional important area involves treatment of visual disturbances in schizophrenia two major questions regarding this are 1 can visual processing be improved in cases where it is impaired and by what types of interventions affecting which cognitive and neurobiological mechanisms and 2 what are the clinical and functional benefits of improving specific visual functions in people with schizophrenia other important and understudied questions concern 1 the extent to which indices of visual functioning can serve as biomarkers such as predictors of relapse treatment response and or recovery 2 the potential role of visual functioning in diagnosing and predicting illness 3 the extent to which some visual perception disturbances are diagnostically specific to schizophrenia and 4 the extent to which visual disturbances are truly manifestations of disease as opposed to aspects of normal variation that in combination with disease serves to modify the clinical presentation this frontiers research topic explores some of these and other issues facing this exciting interface between vision science and schizophrenia research we include papers that span the entire range of different frontiers paper types including those that are data driven using psychophysics electroencephalography neuroimaging computational and animal models and other methods reviews hypotheses theories opinion methods areas of impact and historical perspectives
