this paper argues that the terms money view and credit view are not always well defined in theoretical and empirical debates over the transmission mechanism of monetary policy recent models of information and incentive problems in financial markets suggest the usefulness of decomposing the transmission mechanism into two parts one related to effects of policy induced changes on the overall level of real costs of funds and one related to financial accelerator effects stemming from impacts of policy actions on the financial positions of borrowers or intermediaries the results presented here support the idea that the spending decisions of a significant group of borrowers are influenced by their balance sheet condition whether a bank lending channel is operative is less clear however more micro evidence at the level of individual borrower lender transactions is needed to resolve

is the exchange rate or the money growth rate the better instrument of monetary policy a common argument is that the exchange rate has a natural advantage because it is more transparent it is easier for the public to monitor than the money growth rate we formalize this argument in a simple model in which the government chooses which instrument it will use to target inflation we find that when the government cannot commit to its policies the greater transparency of the exchange rate makes it easier to provide the government with incentives to pursue good policies hence transparency gives the exchange rate a natural advantage over the money growth rate as the monetary policy instrument
