a look at solving problems in three areas of classical elementary mathematics equations and
systems of equations of various kinds algebraic inequalities and elementary number theory in
particular divisibility and diophantine equations in each topic brief theoretical discussions are
followed by carefully worked out examples of increasing difficulty and by exercises which
range from routine to rather more challenging problems while it emphasizes some methods
that are not usually covered in beginning university courses the book nevertheless teaches
techniques and skills which are useful beyond the specific topics covered here with
approximately 330 examples and 760 exercises

this volume covers the topic in functional equations in a broad sense and is written by authors
who are in this field for the past 50 years it contains the basic notions of functional equations
the methods of solving functional equations the growth of functional equations in the last four
decades and an extensive reference list on fundamental research papers that investigate the
stability results of different types of functional equations and functional inequalities this

volume starts by taking the reader from the fundamental ideas to higher levels of results that appear in recent research papers its step by step expositions are easy for the reader to understand and admire the elegant results and findings on the stability of functional equations

this book outlines the modern theory of functional equations and inequalities in several variables it consists of three parts the first is devoted to additive and convex functions defined on linear spaces with semilinear topologies in the second part the problems of stability of functional equations in the sense of ulam hyers rassias and in some function spaces are considered in the last part the functional equations in set valued functions are dealt with for the first time in the mathematical literature the book contains many fresh results concerning those problems

functional equations inequalities and applications provides an extensive study of several important equations and inequalities useful in a number of problems in mathematical analysis subjects dealt with include the generalized cauchy functional equation the ulam stability theory in the geometry of partial differential equations stability of a quadratic functional equation in banach modules functional equations and mean value theorems isometric mappings functional inequalities of iterative type related to a cauchy functional equation the median principle for inequalities and applications hadamard and dragomir agarwal inequalities the euler formulae and convex functions and approximate algebra homomorphisms also included are applications to some problems of pure and applied mathematics this book will be of particular interest to mathematicians and graduate students whose work involves functional equations inequalities and applications

confused about the various concepts on equations inequalities and graphs taught in school or simply want more practice questions this book on equations inequalities and graphs seeks to offer a condensed version of what you need to know for your journey in igcse mathematics alongside with detailed worked examples and extra practice questions tips on certain question types are provided to aid in smoothing the working process when dealing with them
