this second thoroughly revised updated and enlarged edition provides a straightforward introduction to spectroscopy showing what it can do and how it does it together with a clear integrated and objective account of the wealth of information that may be derived from spectra it also features new chapters on spectroscopy in nano dimensions nano optics and polymer analysis clearly structured into sixteen sections it covers everything from spectroscopy in nanodimensions to medicinal applications spanning a wide range of the electromagnetic spectrum and the physical processes involved from nuclear phenomena to molecular rotation processes in addition data tables provide a comparison of different methods in a standardized form allowing readers to save valuable time in the decision process by avoiding wrong turns and also help in selecting the instrumentation and performing the experiments these four volumes are a must have companion for daily use in every lab

the ability of condensation polymers to undergo additional chemical reactions so called transreactions is really fascinating these processes lead to novel copolymers with desired composition and sequential order allow to enhance the compatibility and to minimize molecular weight fluctuations during polycondensation and processing and to provide for chemical healing of laminates of condensation polymers an international team of highly reputed polymer chemists and physicists discusses here first of all various types of transreactions but additional condensations are also detailed in many cases a comprehensive book of high interest to any polymer scientist in academia and industry
