laboratory testing on aggregate fill with and without geosynthetic material showed improvements in shear strength parameters and permanent deformation behavior when reinforced with geosynthetic due to lateral restraint effect at the soil geosynthetic interface bridge II testing under static loads indicated maximum deflections close to 0.9 in and non uniform deflections transversely across the bridge due to poor load transfer between rrfcs the ratio of horizontal to vertical stresses in the grs fill was 1/3 less than 0.25 indicating low lateral stress on the soil surrounding grs fill material bearing capacity analysis at bridge 2 indicated lower than recommended factor of safety fs values due to low ultimate reinforcement strength of the geosynthetic material used in this study and relatively weak underlying foundation layer
