today our world increasingly is conceived of as being molecular an ever widening range of phenomena are described logically in terms of molecular properties and molecular interactions the majority of known molecules are heterocyclic and heterocycles dominate the fields of biochemistry medicinal chemistry dyestuffs photographic science and are of increasing importance in many others including polymers adhesives and molecular engineering thus the importance of heterocyclic chemistry continues to increase and this three volume work by drs r r gupta mahendra kumar and vandana gupta is a welcome addition to the available guides on the subject its scope places it in a useful niche between the single volume texts and monographs of heterocyclic chemistry and the multivolume treatises the authors have retained the well tried classical approach

but have succeeded in placing their own individual spin on their arrangement they have put together a well selected range from among the most important of the vast array of facts available this factual material is ordered in a clear and logical fashion over the three volumes the present work should be of great value to students and practitioners of heterocyclic chemistry at all levels from the advanced undergraduate upwards it will be of particular assistance in presenting a clear and modern view of the subject to those who use heterocycles in a variety of other fields and we wish it well

organophosphorus chemistry is an important discipline within organic chemistry phosphorus compounds such as phosphines trialkyl phosphites phosphine oxides chalcogenides phosphonates phosphinates and  $\text{P}=\text{O}$  species etc may be important starting materials or intermediates in syntheses let us mention the Wittig reaction and the related transformations the Arbuzov and the Pudovik reactions the Kabachnik field condensation the Hirao reaction the Mitsunobu reaction etc other reactions e.g. homogeneous catalytic transformations or C-C coupling reactions involve P ligands in transition metal Pt Pd etc complex catalysts the synthesis of chiral organophosphorus compounds means a continuous challenge methods have been elaborated for the resolution of tertiary phosphine oxides and for stereoselective organophosphorus transformations P heterocyclic compounds including aromatic and bridged derivatives P functionalized macrocycles dendrimers and low coordinated P fragments are also of interest an important segment of organophosphorus chemistry is the pool of biologically active compounds that are searched and used as drugs or as plant protecting agents the natural analogue of P compounds may also be mentioned many new phosphine oxides phosphinates phosphonates and phosphoric esters have been described which may find application on a broad scale phase transfer catalysis ionic liquids and detergents also have connections to phosphorus chemistry green chemical aspects of organophosphorus chemistry e.g. microwave assisted syntheses solvent free accomplishments optimizations and atom efficient syntheses represent a dynamically developing field last but not least theoretical approaches and computational chemistry are also a strong sub discipline within organophosphorus chemistry
