this book is based on notes for a master s course given at queen mary university of london in the 1998 9 session such courses in london are quite short and the course consisted essentially of the material in the rst three chapters together with a two hour lecture on connections with group theory chapter 5 is a considerably expanded version of this for the course the main sources were the books by hopcroft and ullman 20 by cohen 4 and by epstein et al 7 some use was also made of a later book by hopcroft and ullman 21 the ulterior motive in the rst three chapters is to give a rigorous proof that various notions of recursively enumerable language are equivalent three such notions are considered these are generated by a type 0 grammar recognised by a turing machine deterministic or not and defined by means of a godel numbering having defined recursively enumerable for sets of natural numbers it is hoped that this has been achieved without too many arguments using complicated notation this is a problem with the entire subject and it is important to understand the idea of the proof which is often quite simple two particular places that are heavy going are the proof at the end of chapter 1 that a language recognised by a turing machine is type 0 and the proof in chapter 2 that a turing machine computable function is partial recursive
