petrochronology is a rapidly emerging branch of earth science that links time ages or rates with specific rock forming processes and their physical conditions it is founded in petrology and geochemistry which define a petrogenetic context or delimit a specific process to which chronometric data are then linked this combination informs earth s petrogenetic processes better than petrology or geochronology alone this volume and the accompanying short courses address three broad categories of inquiry conceptual approaches chapters include petrologic modeling of multi component chemical and mineralogic systems and development of methods that include diffusive alteration of mineral chemistry methods chapters address four main analytical techniques specifically epma la icp ms sims and tims mineral specific chapters explore applications to a wide range of minerals including zircon metamorphic igneous and detrital haden baddeleyite ree minerals monazite allanite xenotime and apatite titanite rutile garnet and major igneous minerals olivine plagioclase and pyroxenes these applications mainly focus on metamorphic igneous or tectonic processes but additionally elucidate fundamental transdisciplinary progress in addressing mechanisms of crystal growth the chemical consequences of mineral growth kinetics and how chemical transport and deformation affect chemically complex mineral composites most chapters further recommend areas of future

open system behavior is predicated on a fundamental relationship between the timescale over which mass is transported and the timescale over which it is chemically transformed this relationship describes the basis for the multidisciplinary field of reactive transport *rt* in the 20 years since publication of review in mineralogy and geochemistry volume 34 reactive transport in porous media *rt* principles have expanded beyond early applications largely based in contaminant hydrology to become broadly utilized throughout the earth sciences *rt* is now employed to address a wide variety of natural and engineered systems across diverse spatial and temporal scales in tandem with advances in computational capability quantitative imaging and reactive interface characterization techniques the present volume reviews the diversity of reactive transport applications developed over the past 20 years ranging from the understanding of basic processes at the nano to micrometer scale to the prediction of earth global cycling processes at the watershed scale key areas of *rt* development are highlighted to continue advancing our capabilities to predict mass and energy transfer in natural and engineered systems

volume 86 of reviews in mineralogy and geochemistry concentrates on understanding the variations among ratios of the three isotopes of oxygen with primary emphasis on terrestrial systems triple oxygen isotope variations may be related to large mass independent fractionation effects such observed in the earth atmosphere or may be small and related to minute variations due to purely mass dependent processes recent advancements in analytical resolution now allow for the identification of processes and distinct reservoirs that were formerly hidden in the paradigm of a single terrestrial fractionation line new high resolution measurements are accompanied by advances in theoretical calculations that dovetail with empirical calibrations and applications throughout this volume 14 chapters span a wide range of subjects from *ab initio* theoretical approaches to observation of triple oxygen isotope variations in the earth litho hydro and atmosphere

high temperature gas solid reactions are ubiquitous on planetary bodies distributing chemical elements over a range of geologic settings and temperatures this volume reviews the critical role gas solid reactions play in early solar system formation volcanism metamorphism and industrial processes the field evidence experimental and theoretical approaches for examining gas solid reaction are presented building on advances in fields outside of earth sciences computational chemistry techniques are used to probe the nature of molecular clusters and solvation in volcanic vapors and mineral gas reaction mechanisms specialised analytical methods for

characterising solid reaction products are included since these reactions commonly form thin or dispersed films and metastable minerals finally the volume contains rich field examples laboratory experiments and thermodynamic modelling and kinetics of gas solid reactions on earth venus and beyond
