chronicles the forest in new england from the ice age to current challenges

take some of the mystery out of a walk in the woods with this new field guide from the author of reading the forested landscape thousands of readers have had their experience of being in a forest changed forever by reading tom wessels s reading the forested landscape was this forest once farmland was it logged in the past was there ever a major catastrophe like a fire or a wind storm that brought trees down now wessels takes that wonderful ability to discern much of the history of the forest from visual clues and boils it all down to a manageable field guide that you can take out to the woods and use to start playing forest detective yourself wessels has created a key a fascinating series of either or questions to guide you through the process of analyzing what you see you ll feel like a woodland sherlock holmes no walk in the woods will ever be the same

forest loss and degradation have caused a decline in the quality of ecosystem services around the world but fixing the problem takes more than just planting trees practitioners increasingly realize that a landscape approach is essential this handbook authored and edited by international authorities in the

field of forestry is the first practical guide to using forest landscape restoration flr to repair the damage done to forest lands by poor land management practice using research backed by respected institutions such as itto and the world conservation union iucn it explains how to increase the resilience of landscapes and the communities they support through flr the main aim of flr is not to re establish pristine forest even if this were possible rather the objective is to make landscapes more resilient and thereby keep future management options open it also aims to support communities as they strive to increase and sustain the benefits they derive from land management this book explains the concept of flr and guides the reader through the steps that must be taken to put it into practice it is an indispensable aid for practitioners in all aspects of forestry and natural resource management

amsterdamse bos bois de boulogne epping forest grunewald zoni n woud throughout history cities in europe and elsewhere have developed close relationships with nearby woodland areas in some cases cities have even developed and in some cases are promoting a distinct forest identity this book introduces the rich heritage of these city forests as cultural landscapes and shows that cities and forests can be mutually beneficial essential reading for students and researchers interested in urban sustainability and urban forestry this book also has much wider appeal for with city forests playing an increasingly important role in local government sustainability programs it provides an important reference for those involved in urban planning and decision making public affairs and administration and even public health from providers of livelihoods to healthy recreational environments and from places of inspiration and learning to a source of conflict the book presents examples of city forests from around the world these cases clearly illustrate how the social and cultural development of towns and forests has often gone hand in hand they also reveal how better understanding of city forests as distinct cultural and social phenomena can help to strengthen synergies both between cities and forests and between urban society and nature

this book is intended to provide information to those who wish to interact with the landbase in an ecologically sustainable manner practitioners charged with the administration of land based programs in industry and government will find the information presented useful it should also be a resource for many community groups involved in land use decision making humans continue to use forests and make decisions about land use without perfect information conservation biology principles for forested landscapes is intended to enable the improvement of planning and decision making processes by providing ecological information on issues of forest use current approaches are not working where information exists on new ecologically sustainable approaches practitioners should switch where the information on a better approach is not yet available practitioners should replace the current inappropriate approach with a variety of flexible ones that offer the opportunity to change with new knowledge

climate change urban sprawl abandonment of agriculture intensification of forestry and agriculture changes in energy generation and use expansion of infrastructure networks habitat destruction and degradation and other drivers of change occur at increasing rates they affect patterns and processes in forest landscapes and modify ecosystem services derived from those ecosystems consequently rapidly changing landscapes present many new challenges to scientists and managers while it is not uncommon to encounter the terms global change and landscape together in the ecological literature a global analyses of drivers of change in forest landscapes and their ecological consequences have not been addressed adequately that is the goal of this volume an exploration of the state of knowledge of global changes in forested landscapes with emphasis on causes and effects and challenges faced by researchers and land managers initial chapters identify and describe major agents of landscape change climate fire and human activities the next series of chapters address implications of changes on ecosystem services biodiversity conservation and carbon flux a chapter that describes methodologies of detecting and

monitoring landscape changes is presented followed by chapter that highlights the many challenges forest landscape managers face amidst of global change finally we present a summary and a synthesis of the main points presented in the book each chapter will contain the individual research experiences of chapter authors augmented by review and synthesis of global scientific literature on relevant topics as well as critical input from multiple peer reviewers

a compilation of concepts biological relationships and procedures used to organize forested landscapes for combinations of goods services and effects includes such management processes as investments for biological diversity timber production wilderness effects recreational opportunities esthetic values and habitats for endangered animals and plants

this volume combines sound landscape principles with detailed examples and practical advice for the conservation and enhancement of landscape in and around managed forests the author describes the key aesthetic principles and discusses the broader implications of forestry in the landscape numerous examples show how forests can be planned to reflect their surroundings especially in the planting and felling stages the need to combine forestry practice with a wider understanding is stressed the choice of species is discussed as are the design of small woods shelterbelts and forest roadsides

increasing evidence suggests that the composition and spatial configuration the pattern of forest landscapes affect many ecological processes including the movement and persistence of particular species the susceptibility and spread of disturbances such as fires or pest outbreaks and the redistribution of matter and nutrients understanding these issues is key to the successful management of complex multifunctional forest landscapes and landscape ecology

based on a foundation of island bio geography and meta population dynamic theories provides the rationale to deal with this pattern to process interaction at different spatial and temporal scales this carefully edited volume represents a stimulating addition to the international literature on landscape ecology and resource management it provides key insights into some of the applicable landscape ecological theories that underlie forest management with a specific focus on how forest management can benefit from landscape ecology and how landscape ecology can be advanced by tackling challenging problems in forest landscape management it also presents a series of case studies from europe asia north america africa and australia exploring the issues of disturbance diversity management and scale and with a specific focus on how human intervention affects forest landscapes and in turn how landscapes influence humans and their culture an important reference for advanced students and researchers in landscape ecology conservation biology forest ecology natural resource management and ecology across multiple scales the book will also appeal to researchers and practitioners in reserve design ecological restoration forest management landscape planning and landscape architecture

forest loss and degradation have caused a decline in the quality of ecosystem services around the world but fixing the problem takes more than just planting trees practitioners increasingly realize that a landscape approach is essential this handbook authored and edited by international authorities in the field of forestry is the first practical guide to using forest landscape restoration flr to repair the damage done to forest lands by poor land management practice using research backed by respected institutions such as itto and the world conservation union iucn it explains how to increase the resilience of landscapes and the communities they support through flr the main aim of flr is not to re establish pristine forest even if this were possible rather the objective is to make landscapes more resilient and thereby keep future management options open it also aims to support communities as they strive to

while the natural resources of the earth continue to diminish green landscapes are being called upon to produce an increasing range of goods and services a green landscape is a rural expanse of scenery that may comprise a variety of visible features this book focuses on forested landscapes although much of the theory and most of the practical applications are valid for any area of land in many regions of the world people depend on forests for their livelihood and well being forests provide multiple services benefits generated for society by the existence of certain forest ecosystems and their attributes the value of these benefits is often only recognised when they are lost after removal of the trees resulting in a loss of income and declining species diversity forests provide multiple services however the amount and quality and the particular mix of these services depend on the condition of the resource landscape design is a proven way to ensure that certain desired benefits will be available in space and time it provides the foundation and an essential starting point for sustainable management this volume which forms part of springer's book series managing forest ecosystems presents state of the art research results visions and theories as well as specific methods for designing green landscapes as a basis for sustainable ecosystem management the book contains a wealth of information which may be useful to company management the legal and policy environment and forestry administrators the volume is subdivided into four sections

this book explores the concepts premises advancements and challenges in quantifying natural forest landscape patterns through mapping techniques after

several decades of development and use these tools can now be examined for their foundations intentions scope advancements and limitations when applied to natural forest landscapes mapping techniques must address concepts such as stochasticity heterogeneity scale dependence non euclidean geometry continuity non linearity and parsimony as well as be explicit about the intended degree of abstraction and assumptions these studies focus on quantifying natural i e non human engineered forest landscape patterns because those patterns are not planned are relatively complex and pose the greatest challenges in cartography and landscape representation for further interpretation and analysis

restoration ecology as a scientific discipline developed from practitioners efforts to restore degraded land with interest also coming from applied ecologists attracted by the potential for restoration projects to apply and or test developing theories on ecosystem development since then forest landscape restoration flr has emerged as a practical approach to forest restoration particularly in developing countries where an approach which is both large scale and focuses on meeting human needs is required yet despite increased investigation into both the biological and social aspects of flr there has so far been little success in systematically integrating these two complementary strands bringing experts in landscape studies natural resource management and forest restoration together with those experienced in conflict management environmental economics and urban studies this book bridges that gap to define the nature and potential of flr as a truly multidisciplinary approach to a global environmental problem the book will provide a valuable reference to graduate students and researchers interested in ecological restoration forest ecology and management as well as to professionals in environmental restoration natural resource management conservation and environmental policy

the aim of this book is to elucidate the role of forests as part of a landscape in the life of people most landscapes today are cultural landscapes that are influenced by human activity and that in turn have a profound effect on our understanding of and identification with a place the book proposes that a better understanding of the bond between people and forests as integrated part of a landscape may be helpful in landscape planning and may contribute to the discussion of changes in forest cover which has been motivated by land use changes rural development and the global climate debate to this end people s perception of forest landscapes the reasons for different perceptions and future perspectives are discussed given the wide range of forest landscapes and cultural perspectives which exist across the world the book focuses on europe as a test case to explore the various relationships between society culture forests and landscapes it looks at historical evidence of the impacts of people on forests and vice versa explores the current factors affecting people s physical and emotional comfort in forest landscapes and looks ahead to how changes in forest cover may alter the present relationships of people to forests drawing together a diverse literature and combining the expertise of natural and social scientists this book will form a valuable reference for students and researchers working in the fields of landscape ecology and landscape architecture geography social science environmental psychology or environmental history it will also be of interest to researchers government agencies and practitioners with an interest in issues such as sustainable forest management sustainable tourism reserve management urban planning and environmental interpretation
