process planning determines how a product is to be manufactured and is therefore a key element in the manufacturing process it plays a major part in determining the cost of components and affects all factory activities company competitiveness production planning production efficiency and product quality it is a crucial link between design and manufacturing there are several levels of process planning activities early in product engineering and development process planning is responsible for determining the general method of production the selected general method of production affects the design constraints in the last stages of design the designer has to consider ease of manufacturing in order for it to be economic the part design data is transferred from engineering to manufacturing and process planners develop the detailed work package for manufacturing a part dimensions and tolerances are determined for each stage of processing of the workpiece process planning determines the sequence of operations and utilization of machine tools cutting tools fixtures gauges and other accessory tooling are also specified feeds speeds and other parameters of the metal cutting and forming processes are determined

the motivation for this book came out of a shared belief that what passed as theory in operations management om was all too often inadequate in one respect om scholars were bending over backwards to make theories from other fields fit our research problems in another questionable assumptions were being used to apply mathematics to om problems neither proved a good match with what the authors had observed in practice successful operations were managed by considerations that were far more straightforward than much of what was being published the authors of this book codify

these practical considerations into a set of ten fundamental principles that bring together a century of operations management thinking the authors then apply these principles to important topics such as process design process improvement the supply chain new product development project management environmental sustainability and the interfaces between operations management and other business school disciplines

lean is a type of organizational change brought about through improvement methods based on cost reduction mechanism the assumption is that by reducing costs the organizations can work better and more efficiently all changes in lean based organizations are directed at reducing these costs by identifying and eliminating waste the thinking is that cost reduction will increase efficiency since basically it removes process inefficiencies and decreases cycle time why are targets directed at cost reduction because costs are a crucial factor for sustainable business organization lean thinking cuts the value of scale production by looking at the existing waste in a process production remains the same but the costs of goods production are reduced due to the elimination of waste in the process as a result companies do not have to increase their production if it is not required giving companies an increase in average profits due to lean and the elimination of identified waste the focus on cost reduction can be included in the overall lean concept since cost wasting is only a part of the existing waste in other words other waste can be converted into costs or perceived as a value this book starts the mental process of organization change through lean thinking it provides the background and history of lean and then gets into how the lean process works the author also discusses why an organization should implement lean as a method to increase quality and engage workers in the process thereby increasing efficiency and ultimately profitability through case studies and examples from indonesia the author describes how to create a value stream to identify waste and discusses the concept of a pull system and its impact on the process
