lightweight structures and material optimized systems are of major relevance in the building industry and particularly in the design of concrete structures this is not only for aesthetic reasons but also to use material in a resource conserving way the increase of strength characteristics as one measure to reduce cross section dimensions postulates the prefabrication of cementitious materials under laboratory conditions this thesis examines the contradiction of the possibility to realize slender concrete elements and the complexity of the discontinued homogeneity arising from necessary segmentations proposals of implementation strategies are demonstrated and verified on the basis of selected case studies

the main purpose of this volume is to provide a focused analysis of the function of the g protein coupled signaling pathways that operate in the interconnected network of retinal neurons as they detect and encode the information carried by light the organization of this volume will generally follow the path of signal flow in the retina first we will describe recent advances in understanding the phototransduction cascade of rod and cone photoreceptors which use signaling cascade based on the gpcr rhodopsin to transduce incident light into neural activity chapters will be devoted to unique specializations of the two major types of photosensitive cells that comprise the predominant input for our spatial and color vision subsequently the mechanisms of synaptic information encoding by retinal on bipolar cells will be described where the gpcr mglur6 plays a fundamental

role chapters in this section will examine macromolecular organization of the mglur6 signaling pathway as well as current understanding of its function the functional characteristics of this signaling mechanism will be explored in detail additionally this section will cover the role of dopamine receptors in modulating signal transmission between photoreceptors and on bipolar cells finally chapters will be focused on the output neurons of the inner retina ganglion cells where the components of the emerging gpcr melanopsin cascade in intrinsically photosensitive ganglion cells will be detailed collectively these mechanisms allow the retina to represent visual space over a wide range of light intensities
