design and check of reinforced concrete box culverts rectangular single cell enabling crossing below roads and drainage works the analysis model used is that of a thick three dimensional triangular finite element type mesh which considers deformation due to shear they are made up of six nodes at the vertices and mid points of the sides each with six degrees of freedom a mesh is applied on the culvert the spacing of which depending on its dimensions thicknesses and spans by means of a linear elastic analysis eight forces are obtained for each node which are used to check and design the concrete section and reinforcement as well as the displacements other checks that are carried out include deflection ground bearing pressures possible mat foundation uplift etc

this is a study of the analysis and design of reinforced concrete box culverts rcb commonly used as underground conduits in nebraska three major areas were emphasized 1 soil pressures 2 live loads and 3 design procedures

this investigation of a pre cast concrete box culvert was undertaken to determine the suitability of replacing conventional reinforcing steel with a fiber reinforced concrete it can be predicted that fiber reinforced concrete will provide the culvert with a strength and durability that are equivalent to or exceed those provided by the culvert reinforced with conventional reinforcing steel the use of the fiber reinforcement would result in a significant reduction in the labor costs when compared to the fabrication of a pre cast concrete culvert unit reinforced with conventional reinforcing steel ljb inc in conjunction with the university of cincinnati has performed a full scale load test of a 12 foot span 6 foot tall pre cast box culvert reinforced with monofilament polypropylene fibers the objective was to assess the behavior of the fiber reinforced culvert both experimentally and analytically and to determine the feasibility of using the fiber reinforced culvert in place of the commonly used standard reinforced unit during construction of the bridge the fiber reinforced culvert was load tested utilizing a load actuator mounted on top strains and deflections were recorded using instruments mounted at strategic locations recorded strains and deflections were compared to theoretical values obtained from three finite element models the results of this investigation generated positive results however due to the presence of a crack that had developed near the mid span of the culvert prior to load testing further testing is suggested even with this crack the results suggest the future success of the use of fibers to replace conventional reinforcing steel

the main purpose of this project is to design a one piece reinforced concrete box culvert and to establish whether it is a viable alternative to the two piece design currently being used and produced by the roads corporation the design of the one piece box culvert is in accordance with the specifications produced by the national association of the australian state road authorities naasra 1976 road design manual 1985 the australian standards for concrete structures as3600 1988 and finally in accordance with vic roads roads corporation own design specifications conclusions were based upon the overall design of the one piece box culvert taking into account its configuration i e wall thicknesses reinforcement layout the formwork s suitability for repetitive use and in general the work associated with such a culvert design during the manufacturing and

installation stages these factors will then be compared to those associated with the current two piece box culvert process to determine whether in fact the one piece is a viable alternative based upon these economic and ergonomic factors synopsis
