the latest advancements in time scale calculus are the focus of this book new types of time scale integral transforms are discussed in the book along with how they can be used to solve dynamic equations novel numerical techniques for partial dynamic equations on time scales are described new time scale inequalities for exponentially convex functions are introduced as well

this monograph is devoted to developing a theory of combined measure and shift invariance of time scales with the related applications to shift functions and dynamic equations the study of shift closeness of time scales is significant to investigate the shift functions such as the periodic functions the almost periodic functions the almost automorphic functions and their generalizations with many relevant applications in dynamic equations on arbitrary time scales first proposed by s hilger the time scale theory a unified view of continuous and discrete analysis has been widely used to study various classes of dynamic equations and models in real world applications measure theory based on time scales in its turn is of great power in analyzing functions on time scales or hybrid domains as a new and exciting type of mathematics and more comprehensive and versatile than the traditional theories of differential and difference equations the time scale theory can precisely depict the continuous discrete hybrid processes and is an optimal way forward for accurate mathematical modeling in applied sciences such as physics chemical technology population dynamics biotechnology and economics and social sciences graduate students and researchers specializing in general dynamic equations on time scales can benefit from this work fostering interest and further research in the field it can also serve as reference material for undergraduates interested in dynamic equations on time scales prerequisites include familiarity with functional analysis measure theory and ordinary differential equations

the theory of difference equations the methods used in their solutions and their wide applications have advanced beyond their adolescent stage to occupy a central position in applicable analysis in fact in the last five years the proliferation of the subject is witnessed by hundreds of research articles and several monographs two international conferences and numerous special sessions and a new journal as well as several special issues of existing journals all devoted to the theme of difference equations now even those experts who believe in the universality of differential equations are discovering the sometimes striking divergence between the continuous and the discrete there is no doubt that the theory of difference equations will continue to play an important role in mathematics as a whole in 1992 the first author published a monograph on the subject entitled difference equations and inequalities this book was an in depth survey of the field up to the year of publication since then the subject has grown to such an extent that it is now quite impossible for a similar survey even to cover just the results obtained in the last four years to be written in the present monograph we have collected some of the results which we have obtained in the last few years as well as some yet unpublished ones

mathematical programming has know a spectacular diversification in the last few decades this process has happened both at the level of mathematical research and at the level of the applications generated by the solution methods that were created to write a monograph dedicated to a certain domain of mathematical programming is under such circumstances especially difficult in the present monograph we opt for the domain of fractional programming interest of this subject was generated by the fact that various optimization problems from engineering and economics consider the minimization of a ratio between physical and or economical functions for example cost time cost volume cost profit or other quantities that measure the efficiency of a system for example the productivity of industrial systems defined as the ratio between the realized services in a system within a given period of time and the utilized resources is used as one of the best indicators of the quality of their operation such problems where the objective function appears as a ratio of functions constitute fractional programming problem due to its importance in modeling various decision processes in management science operational research and economics and also due to its frequent appearance in

other problems that are not necessarily economical such as information theory numerical analysis stochastic programming decomposition algorithms for large linear systems etc the fractional programming method has received particular attention in the last three decades
