this edited volume event related potentials and evoked potentials is a collection of reviewed and relevant research chapters offering a comprehensive overview of recent developments in the field of medicine and health sciences the book comprises single chapters authored by various researchers and edited by an expert active in the field of event related potential erp an event related potential erp is the measured brain response that is the direct result of a specific sensory cognitive or motor event each chapter is complete in itself but united under a common research study topic this publication aims at providing a thorough overview of the latest research efforts by international authors in noninvasive means of evaluating brain functioning and opens new possible research paths for further novel developments

in the last 15 years a recognizable surge in the field of brain computer interface bci research and development has emerged this emergence has sprung from a variety of factors for one inexpensive computer hardware and software is now available and can support the complex high speed analyses of brain activity that is essential is bci another factor is the greater understanding of the central nervous system including the abundance of new information on the nature and functional correlates of brain signals and improved methods for recording these signals in both the short term and long term and the third and perhaps most significant factor is the new recognition of the needs and abilities of people disabled by disorders such as cerebral palsy spinal cord injury stroke amyotrophic lateral sclerosis als multiple sclerosis and muscular dystrophies the severely disabled are now able to live for many years and even those with severely limited voluntary muscle control can now be given the most basic means of communication and control because of the recent advances in the technology research and applications of bci this book is intended to provide an introduction to and summary of essentially all major aspects of bci research and development its goal is to be a comprehensive balanced and coordinated presentation of the field s key principles current practice and future prospects

the two volume set lnai 15246 and 15247 constitutes the proceedings of the 23rd mexican international conference on artificial intelligence micai 2024 held in tonantzintla mexico in october 21 25 2024 the 37 full papers presented in these proceedings were carefully reviewed and selected from 141 submissions the papers presented in these two volumes are organized in the following topical sections part i machine learning computer vision part ii intelligent systems bioinformatics and medical applications natural language processing

this research topic is dedicated to raja parasuraman who unexpectedly passed on march 22nd 2015 raja parasuraman s pioneering work led the emergence of neuroergonomics as a new scientific field he combined his research interests in the field of neuroergonomics which he defined as the study of the human brain in relation to performance at work and everyday settings raja parasuraman was a pioneer a truly exceptional researcher and an extraordinary person he made significant contributions to a number of disciplines from human factors to cognitive neuroscience his advice to young researchers was to be passionate in order to develop theory and knowledge that can guide the design of technologies and environments for people his legacy the field of neuroergonomics will live on in countless faculties and students whom he advised and inspired with unmatched humility throughout the whole of his distinguished career raja parasuraman was an impressive human being a very kind person and an absolutely inspiring individual who will be remembered by everyone who had the chance to meet him about this research topic since the advent of neuroergonomics significant progress has been made with respect to methodology and tools for the investigation of the brain and behavior at work this is especially the case for neuroscientific methods where the availability of ambulatory hardware wearable sensors and advanced data analyses allow for imaging of brain dynamics in humans in applied environments methods such as electroencephalography eeg functional near infrared spectroscopy fnirs and stimulation approaches like transcranial direct current stimulation tdc's have made significant progress in both recording and altering brain activity while allowing full body movements outside laboratory environments for neuroergonomics the application of brain imaging

in real world scenarios is highly relevant traditionally brain imaging experiments in human factors research tend to avoid active behavior for fear of artifacts and a contaminated data set that would provide limited insight into brain dynamics in real working environments to overcome these problems new analyses approaches have to be developed that identify artifacts resulting from hostile recording environments and movement related non brain activity stemming from eye head and full body movements the application of methodology from the field of brain computer interfacing bci for neuroergonomics is one approach that has significant potential to enhance ambulatory monitoring and applied testing passive bcis allow for assessing aspects of the user state online such that systems can automatically adapt to their user this neuroadaptive technology could lead to highly efficient working environments to auto adaptive experimental paradigms and to a continuous tracking of cognitive and affective aspects of the user state hence deployment of portable neuroimaging technologies to real time settings could help assess cognitive and motivational states of personnel assigned to perform critical tasks this research topic gathers submissions that cover new approaches in neuroergonomics different article type cover advanced neuroscience methods and neuroergonomics techniques as well as analysis approaches to investigate brain dynamics in working environments the selection of papers provides insights into new neuroergonomic research approaches that demonstrate significant advances in brain imaging technologies that become more and more mobile moreover a strong trend for new analyses approaches and paradigms investigating real work settings can be seen together this unique collection of latest research papers provides a comprehensive overview on the latest developments in neuroergonomics
