there are three non mutually exclusive reasons to read this book i you love science ii you do science and or iii you teach science as a teacher of general chemistry i have found myself teaching things from modern textbooks that have been by the year 2000 rehashed many times by generations of textbook

authors and college professors over the years much of the detail of history has been lost some of the important caveats associated with the original research have been stripped away and the material has become dogmatic today it is hard to believe that in 1900 learned scholars could debate the existence of atoms and molecules ironically if albert einstein had done nothing else his 1905 paper on the movement of small particles suspended in stationary liquids required by the molecular kinetic theory of heat annalen der physik 17 1905 549 560 would have been regarded as important to proving the existence of molecules atoms and our modern theory of thermodynamics modern textbooks generally do not spend much time discussing how we made this critical passage from the ignorance of 1600 to the enlightenment of 2000 and at one time i was a strong believer that it was a waste of time to consider the history complete with personal tribulations priority disputes missteps false starts and general confusion of scientific study but i have come to believe that we now accept some ideas as facts and have not thoroughly questioned the hypotheses of renowned scientists in this informal history compiled largely from popular secondary sources i am not going to deeply criticize the pathway or results that have been used to construct our modern view of matter and energy but i did want to give the general reader and interested student an outline of how we got here hopefully this approach will convert the pillars of modern chemistry and physics from infallible icons into imperfect people with imperfect hypotheses that we should feel free indeed obligated to question and challenge besides that perhaps looking at how these people came to their discoveries will suggest methods of reasoning and investigation to modern researchers

within the pages of matter and energy you will find nature's wondrous secrets revealed the very foundation of the everything theory the theory that einstein sought after for so long lies with the pages of this book exciting new comprehensive theories and proofs will be presented in classical physics the primary concentrations of energy in the universe are found in large bodies of matter such as the sun in this book most of the energy as well as matter itself is found elsewhere you will find these pages full of new interesting and exciting theories including proofs on how the universe functions a significant amount of work has been done on the four forces gravity electrical weak nuclear and strong nuclear forces this book includes serious discussions and theories on how the mechanics of matter function including discussions on how the five states of matter function within the pages of matter and energy you will discover the ultimate mass particle and its role in the universe if the theories in matter and energy are accepted they will have an earth shaking effect on physical science and the entire scientific community it is my sincere desire that you find the theories and proofs presented within these pages as interesting and exciting as i do

a textbook exploring such aspects of matter and energy as heat electricity and nuclear chemistry with suggested activities and review questions at the end of each chapter

readers learn about energy and matter including the many variations of energy and of particles in nature albert einstein's discoveries about matter dark matter and dark energy and the newest theories on the future of the universe

my intention in this book is to describe in simple language using a minimum of mathematics but a maximum of numerical values the most important

developments of science dealing with matter and energy on cosmic and global scales in the conventional literature all of these findings are distributed among books and journals on physics astronomy chemistry geology biology energy engineering and the environmental sciences the main purpose here is to attempt to give a unified description of nature from the elementary particles to the universe as a whole this is used as a basis for analysing the future development of mankind the future evolution of the universe galaxies stars and planets gives some hope for the destiny of mankind the problem of matter and energy flow on the earth appears soluble even for the distant future there seems to be no reason why a long period of human development on this planet should not be possible the book has been prepared based on my lectures at the warsaw university from 1959 to 1968 and during the 15 years 1969 1983 at the swiss federal institute of technology eidgenossische technische hochschule in zurich and at the university of zurich i wish to give my sincere thanks to the swiss federal institute for reactor research at wurenlingen for their constant support i am especially grateful to mrs christine stratton for setting up the english text and to mr r w stratton and lg mckinley for their helpful criticisms and remarks

discusses the scientific principles behind the laws of conservation of matter the combination of elements the periodic table and the first and second law of thermodynamics and describes the work of the scientists who discovered them
