this report describes planar a data reduction program for wind tunnel free flight tests which utilizes data from a single plane the program calculates moment force and in the case of a spinning model magnus coefficients the program is written for an ibm 7090 computer operating under the ibsys monitor the mathematical formulation of the problem and the computer program are presented the program description includes a fortran listing and instructions for its use author

this report deals primarily with extension of the energy based concepts of dynamic stability developed earlier for finite degree of freedom systems to continuous systems moreover the related criteria for dynamic stability are demonstrated through several structural configurations such as eccentrically loaded simple two bar frames geometrically imperfect thin cylindrical shells of stiffened and unstiffened construction and subjected to uniform axial compression and lateral pressure and a pinned half sine shallow arch loaded transversely all of these systems are subject to violent buckling under static application of the loads moreover the developed concepts are extended so as to apply to structural systems which are either subject to smooth buckling or are not subject to buckling at all under static loading

computer aided design of multivariable technological systems covers the proceedings of the second international federation of automatic control ifac the book reviews papers that discuss topics about the use of computer aided design cad in designing multivariable system such as theoretical issues applications and implementations the book tackles several topics relevant to the use of cad in designing multivariable systems topics include quasi classical approach to multivariable feedback system designs fuzzy control for multivariable systems root loci with multiple gain parameters multivariable frequency domain stability criteria and computational algorithms for pole assignment in linear multivariable systems the text will be of great use to professionals whose work involves designing and implementing multivariable systems

a computational method for lateral directional aerodynamics of fighter configurations is developed the leading edge vortices are represented by free vortex filaments which are adjusted iteratively to satisfy the force free condition the forebody vortex separation both symmetrical and asymmetrical is calculated using slender body theory effect of boundary layer separation on lifting surfaces is accounted for using the effective sectional angles of attack the latter are obtained iteratively by matching the nonlinear sectional lift

with the computed resulted based on lifting surface theory results for several fighter configurations are employed for comparison with available data it is shown that the present method produces reasonable results in predicting sideslip derivatives while roll and yaw rate derivatives do not compare very well with forced oscillation test data at high angles of attack industrial usage of this has produced mixed results at this time the use of these methods in a production manner is not recommended
