system level testing is becoming increasingly important it is driven by the incessant march of complexity which is forcing us to renew our thinking on the processes and procedures that we apply to test and diagnosis of systems in fact the complexity defines the system itself which for our purposes is any aggregation of related elements that together form an entity of sufficient complexity for which it is impractical to treat all of the elements at the lowest level of detail system approaches embody the partitioning of problems into smaller inter related subsystems that will be solved together thus words like hierarchical dependence inference model and partitioning are frequent throughout this text each of the authors deals with the complexity issue in a similar fashion but the real value in a collected work such as this is in the subtle differences that may lead to synthesized approaches that allow even more progress the works included in this volume are an outgrowth of the 2nd international workshop on system test and diagnosis held in alexandria virginia in april 1998 the first such workshop was held in freiburg germany six years earlier in the current workshop nearly 50 experts from around the world struggled over issues concerning the subject in this volume a select group of workshop participants was invited

to provide a chapter that expanded their workshop presentations and incorporated their workshop interactions while we have attempted to present the work as one volume and requested some revision to the work the content of the individual chapters was not edited significantly consequently you will see different approaches to solving the same problems and occasional disagreement between authors as to definitions or the importance of factors the works collected in this volume represent the state of the art in system test and diagnosis and the authors are at the leading edge of that science from the preface

soc test design and its optimization is the topic of introduction to advanced system on chip test design and optimization it gives an introduction to testing describes the problems related to soc testing discusses the modeling granularity and the implementation into eda electronic design automation tools the book is divided into three sections i test concepts ii soc design for test and iii soc test applications the first part covers an introduction into test problems including faults fault types design flow design for test techniques such as scan testing and boundary scan the second part of the book discusses soc related problems such as system modeling test conflicts power consumption test access mechanism design test scheduling and defect oriented scheduling finally the third part focuses on soc applications such as integrated test scheduling and tam design defect oriented scheduling and integrating test design with the core selection process

savin 1976 and berndt and savin 1977 among others have pointed out that an inequality relation exists between the lagrange multiplier test the wald test and the likelihood ratio test however since all tests converge to the same limiting chi square distribution they are usually compared against the same critical value this raises the possibility of conflicting conclusions from the three tests kohler 1979 and vandaele 1981 have shown that the three tests are monotonic functions of each other this implies that they have identical power characteristics in particular if the probabilities of type i errors are equal among the three tests they have to have the same probability of type ii errors as well in essence we are dealing with one and the same test in this paper we review briefly how the tests are related and why the inequality relation exists we then derive criteria which allow us to determine which test is more appropriate in a given situation this should resolve possible conflicts for at least some sets of circumstances
