this report describes laboratory and field tests conducted using a new fiber stabilization technique for sands laboratory unconfined compression tests using 2 in long monofilament polypropylene fibers to stabilize a poorly graded sp sand showed an optimum fiber content of 1 percent by weight field test sections were constructed and traffic tested using simulated c 130 aircraft traffic 30 000 lb tire load at 100 psi tire pressure and military truck traffic 5 ton military cargo truck loaded to a gross weight of 41 600 lb test results showed that sand fiber stabilization over a sand subgrade supported over 1 000 passes of a c 130 tire load with less than 2 in of rutting the top 4 in of the sand fiber layer was lightly stabilized with road oyl to provide a wearing surface based on limited truck traffic tests an 8 in thick sand fiber layer surfaced with a spray application of road oyl would support substantial amounts of military truck traffic

in the early 1970s a start was made on a broad review of what was known or could be surmised about sedimentation by strong tidal currents on modern continental shelves this task was initiated because of the need to define the next phase of research in this field by the marine geology group of the institute of oceanographic sciences related indications of the longer term evolution of the deposits were sought by close reference to the nature of modern tidal currents and the supposedly offshore tidal deposits of ancient seas as the review grew in completeness it became of increasing relevance to a wider audience so it was amalgamated with the new results and shaped as a book the fruits of the long continued discussions within and outside the geology group have served to improve understanding of the processes and products of offshore tidal current sedimentation on the other hand the discussions have blurred the parts played by the people concerned this applies to all chapters in varying degrees but is especially true for chapters 3 4 and 5 the authorship attributed to each chapter therefore seeks to reflect those who were most concerned with it

the first edition appeared fourteen years ago since then there have been significant advances in our science that warrant an updating and revision of sand and sandstone the main framework of the first edition has been retained so that the reader can begin with the mineralogy and textural properties of sands and sandstones progress through their organization and classification and their study as a body of rock to consideration of their origin prove nance transportation deposition and lithification and finally to their place in the stratigraphic column and the basin the last decade has seen the rise of facies analysis based on a closer look at the stratigraphic record and the recognition of characteristic bed ding sequences that are the signatures of some geologic process such as a prograding shallow water delta or the migration of a point bar on an alluvial floodplain the environment of sand deposition is more closely determined by its place in such depositional systems than by criteria based on textural characteristics the fingerprint approach our revision reflects this change in thinking as in the geological sciences as a whole the concept of plate tectonics has required a rethinking of our older ideas about the origin and accumulation of sediments especially the nature of the sedimentary basins
