this text introduces topos theory a development in category theory that unites important but seemingly diverse notions from algebraic geometry set theory and intuitionistic logic topics include local set theories fundamental properties of toposes sheaves local valued sets and natural and real numbers in local set theories
1988 edition

the author introduces lawvere and tierney's concept of topos theory a striking development in category theory that unites a number of important but seemingly

diverse notions from algebraic geometry set theory and intuitionistic logic topos theory has led to the forging of surprising new links between classical and constructive mathematics bell presents toposes as the models of theories the so called local set theories formulated within a typed intuitionistic logic

topos theory provides an important setting and language for much of mathematical logic and set theory it is well known that a typed language can be given for a topos to be regarded as a category of sets this enables a fruitful interplay between category theory and set theory however one stumbling block to a logical approach to topos theory has been the treatment of geometric morphisms this book presents a convenient and natural solution to this problem by developing the notion of a frame relative to an elementary topos the authors show how this technique enables a logical approach to be taken to topics such as category theory relative to a topos and the relative giraud theorem the work is self contained except that the authors presuppose a familiarity with basic category theory and topos theory logicians set and category theorists and computer scientist working in the field will find this work essential reading

this is the tenth volume in a series on information modelling and knowledge bases the topics of the articles cover a wide variety of themes in the domain of information modelling design and specification of information systems and knowledge bases ranging from foundations and theories to systems construction and application studies the contributions in this volume represent the following major themes models in intelligent activity concept modelling and conceptual modelling conceptual modelling and information requirements specification collections of concepts knowledge base design and database design human computer interaction and modelling software engineering and modelling and applications

this monograph presents a new systematic treatment of the relation between classifying topoi and classifying spaces of topological categories using a new generalized geometric realization which applies to topoi a weak homotopy equivalence is constructed between the classifying space and the classifying topos of any small topological category topos theory is then applied to give an answer to the question of what structures are classified by classifying spaces the monograph should be accessible to anyone with basic knowledge of algebraic topology sheaf theory and a little topos theory
