this contributed volume offers a comprehensive and detailed overview of the various aspects of long non coding rnas and discusses their emerging significance written by leading experts in the field it motivates young researchers around the globe and offers graduate and postgraduate students fascinating insights into genes and their regulation in eukaryotes and higher organisms

error correcting coding is often analyzed in terms of its application to the separate levels within the data network in isolation from each other in this fresh approach the authors consider the data network as a superchannel a multi layered entity which allows error correcting coding to be evaluated as it is applied to a number of network layers as a whole by exposing the problems of applying error correcting coding in data networks and by discussing coding theory and its applications this original technique shows how to correct errors in the network through joint coding at different network layers discusses the problem of reconciling coding applied to different layers using a superchannel approach includes thorough coverage of all the key codes linear block codes hamming bch and reed solomon codes ldpc codes decoding as well as convolutional turbo and iterative coding considers new areas of application of error correcting codes such as transport coding code based cryptosystems and coding for image compression demonstrates how to use error correcting coding to control such important data characteristics as mean message delay provides theoretical explanations backed up by numerous real world examples and practical recommendations features a companion website containing additional research results including new constructions of ldpc codes joint error control coding and synchronization reed muller codes and their list decoding by progressing from theory through to practical problem solving this resource contains invaluable advice for researchers postgraduate students engineers and computer scientists interested in data communications and applications of coding theory

the discovery in 1977 that genes are split into exons and introns has done away with the one gene one protein dogma indeed the removal of introns from the primary rna transcript is not necessarily straightforward since there may be optional pathways

leading to different messenger rnas and consequently to different proteins examples of such an alternative splicing mechanism cover all fields of biology moreover there are plenty of occurrences where deviant splicing can have pathological effects despite the high number of specific cases of alternative splicing it was not until recently that the generality and extent of this phenomenon was fully appreciated a superficial reading of the preliminary sequence of the human genome published in 2001 led to the surprising and even deceiving to many scientists low number of genes around 32 000 which contrasted with the much higher figure around 150 000 which was previously envisioned attempts to make a global assessment of the use of alternative splicing are recent and rely essentially on the comparison of genomic mrna and est sequences as reviewed by thanaraj and stamm in the first chapter of this volume most recent estimates suggest that 40 60 of human genes might be alternatively spliced as opposed to about 22 for c elegans
