since the appearance of vol 1 of models of neural networks in 1991 the theory of neural nets has focused on two paradigms information coding through coherent firing of the neurons and functional feedback information coding through coherent neuronal firing exploits time as a cardinal degree of freedom this capacity of a neural network rests on the fact that the neuronal action potential is a short say 1 ms spike localized in space and time spatial as well as temporal correlations of activity may represent different states of a network in particular temporal correlations of activity may express that neurons process the same object of for example a visual scene by spiking at the very same time the traditional description of a neural network through a firing rate the famous s shaped curve presupposes a wide time window of say at least 100 ms it thus fails to exploit the capacity to bind sets of coherently firing neurons for the purpose of both scene segmentation and figure ground segregation feedback is a dominant feature of the structural

organization of the brain recurrent neural networks have been studied extensively in the physical literature starting with the ground breaking work of john hop field 1982
