facilities design covers modeling and analysis of the design layout and location of facilities it also covers design and analysis of materials handling

abstract the functional flowline and cellular layouts are traditional facility layouts that have been discussed in the literature and implemented in industry selection of an appropriate layout for a multi product facility poses a major challenge since the best decomposition of its material flow

network is usually achieved by a hybrid layout that must combine the flow and machine grouping attributes of the three traditional layouts unfortunately the systematic layout planning slp design process does not describe specific methods for product mix segmentation and department planning for design of jobshop layouts it lacks a systematic method for varying the manufacturing focus of the different planning departments or activities into which the jobshop can be decomposed we enhance the slp process by integrating production flow analysis pfa into slp adoption of algorithms and principles of pfa in the process of slp can eliminate the two limitations of slp a incapability of using product routings instead of the from to chart as input data and b incapability of generating layouts that are a hybrid combination of functional and cellular layouts a review of the literature shows that a fundamental requirement for the design of modern facility layouts is the distribution of identical machines at multiple locations in the facility our research shows that the material flow network in any facility layout can be decomposed into a network of layout modules with each module representing a portion of the entire facility a layout module is defined as a group of machines connected by a material flow network that exhibits a flow pattern characteristic of a specific type of layout such as the flowline cellular or functional layout the concept of layout modules extends current thinking on input data requirements and methods for facility layout and supports the need for a new generation of facility layouts beyond the three traditional layouts that continue to be studied and implemented in industry we propose a group technology based heuristic approach as an alternative method for generation of layout modules and design of modular layouts based on a new similarity measure for comparison of operation sequences

this book takes a modern view of the field of facilities planning and design along with a unified body of relevant knowledge motivating and illustrating mathematical models wherever possible the book explores facilities planning capstone design and even simulation modelling a design project incorporates the theoretical aspects of facilities planning and design the book also covers decision support methodology and computerized procedures for industrial engineers facilities managers and plant managers

production planning and control draws on practitioner experiences on the shop floor covering everything a manufacturing or industrial engineer needs to know on the topic it provides basic knowledge on production functions that are essential for the effective use of pp c techniques and tools it is written in an approachable style thus making it ideal for readers with limited knowledge of production planning comprehensive coverage includes quality management lean management factory planning and how they relate to pp c end of chapter questions help readers ensure they have grasped the most important concepts with its focus on actionable knowledge and broad coverage of essential reference material this is the ideal pp c resource to accompany work research or study uses practical examples from the industry to clearly illustrate the concepts presented provides a basic overview of statistics to accompany the introduction to forecasting covers the relevance of pp c to key emerging themes in manufacturing technology including the industrial internet of things and industry 4
