designed for courses at advanced undergraduate or graduate level in industrial engineering and business this text provides a review of various aspects of simulation study including modelling simulation software validation and output data analysis

non uniform random variate generation is an established research area in the intersection of mathematics statistics and computer science although random variate generation with popular standard distributions have become part of every course on discrete event simulation and on monte carlo methods the recent concept of universal also called automatic or black box random variate generation can only be found dispersed in literature this new concept has great practical advantages that are little known to most simulation practitioners being unique in its overall organization the book covers not only the mathematical and statistical theory but also deals with the implementation of such methods all algorithms introduced in the book are designed for practical use in simulation and have been coded and made available by the authors examples of possible applications of the presented algorithms including option pricing var and bayesian statistics are presented at the end of the book

researchers develop simulation models that emulate real world situations while these simulation models are simpler than the real situation they are still quite complex and time consuming to develop it is at this point that metamodeling can be used to help build a simulation study based on a complex model a metamodel is a simpler analytical model auxiliary to the simulation model which is used to better understand the more complex model to test hypotheses about it and provide a framework for improving the simulation study the use of metamodels allows the researcher to work with a set of mathematical functions and analytical techniques to test simulations without the costly running and re running of complex computer programs in addition metamodels have other advantages and as a result they are being used in a variety of ways model simplification optimization model interpretation generalization to other models of similar systems efficient sensitivity analysis

and the use of the metamodel's mathematical functions to answer questions about different variables within a simulation study
