precise dynamic models of processes are required for many applications ranging from control engineering to the natural sciences and economics frequently such precise models cannot be derived using theoretical considerations alone therefore they must be determined experimentally this book treats the determination of dynamic models based on measurements taken at the process which is known as system identification or process identification both offline and online methods are presented i e methods that post process the measured data as well as methods that provide models during the measurement the book is theory oriented and application oriented and most methods covered have been used successfully in practical applications for many different processes illustrative examples in this book with real measured data range from hydraulic and electric actuators up to combustion engines real experimental data is also provided on the springer webpage allowing readers to gather their first experience with the methods presented in this book among others the book covers the following subjects determination of the non parametric frequency response fast fourier transform correlation analysis parameter estimation with a focus on the method of least squares and modifications identification of time variant processes identification in closed loop identification of continuous time processes and subspace methods some methods for nonlinear system identification are also considered such as the extended kalman filter and neural networks the different methods are compared by using a real three mass oscillator process a model of a drive train for many identification methods hints for the practical implementation and application are provided the book is intended to meet the needs of students and practicing engineers working in research and development design and manufacturing

the third edition of modeling and anaysis of dynamic systems continues to present students with the methodology applicable to the modeling and analysis of a variety of dynamic systems regardless of their physical origin it includes detailed modeling of mechanical electrical electro mechanical thermal and fluid systems models are developed in the form of state variable equations input output differential equations transfer functions and block diagrams the laplace transform is used for analytical solutions computer solutions are based on matlab and simulink examples include both linear and nonlinear systems an introduction is given to the modeling and design tools for feedback control systems the text offers considerable flexibility in the selection of material for a specific course students majoring in many different engineering disciplines have used the text such courses are frequently followed by control system design courses in the various disciplines

as experimental data sets have grown and computational power has increased new tools have been developed that have the power to model new systems and fundamentally alter how current systems are analyzed this book brings together modern computational tools to provide an accurate understanding of dynamic data the techniques build on pencil and paper mathematical techniques that go back decades and sometimes even centuries the result is an introduction to state of the art methods that complement rather than replace traditional analysis of time dependent systems data driven methods for dynamic systems provides readers with methods not found in other texts as well as novel ones developed just for this book an example driven presentation that provides background material and descriptions of methods without getting bogged down in technicalities and examples that demonstrate the applicability of a method and introduce the features and drawbacks of their application the online supplementary material includes a code repository that can be used to reproduce every example and that can be repurposed to fit a variety of applications not found in the book this book is intended as an introduction to the field of data driven methods for graduate students it will also be of interest to researchers who want to familiarize themselves with the discipline it can be used in courses on dynamical systems differential equations and data science

this text discusses the qualitative properties of dynamical systems including both differential equations and maps the approach taken relies heavily

on examples supported by extensive exercises hints to solutions and diagrams to develop the material including a treatment of chaotic behavior the unprecedented popular interest shown in recent years in the chaotic behavior of discrete dynamic systems including such topics as chaos and fractals has had its impact on the undergraduate and graduate curriculum however there has until now been no text which sets out this developing area of mathematics within the context of standard teaching of ordinary differential equations applications in physics engineering and geology are considered and introductions to fractal imaging and cellular automata are given
