this is the second part of a series of papers called hag devoted to developing the foundations of homotopical algebraic geometry the authors start by defining and studying generalizations of standard notions of linear algebra in an abstract monoidal model category such as derivations étale and smooth morphisms flat and projective modules etc they then use their theory of stacks over model categories to define a general notion of geometric stack over a base symmetric monoidal model category c and prove that this notion satisfies the expected properties

designed for undergraduate and postgraduate students of mathematics the book can also be used by those preparing for various competitive examinations the text starts with a brief introduction to results from set theory and number theory it then goes on to cover groups rings fields and linear algebra the topics under groups include subgroups finitely generated abelian groups group actions solvable and nilpotent groups the course in ring theory covers ideals embedding of rings euclidean domains pids ufd's polynomial rings noetherian artinian rings topics of field include algebraic extensions splitting fields normal extensions separable extensions algebraically closed fields galois extensions and construction by ruler and compass the portion on linear algebra deals with vector spaces linear transformations eigen spaces
