we present results from an adaptive optics survey conducted with the palomar and keck telescopes over 3 years which measured the frequency of stellar and sub stellar companions to sun like stars the survey sample contains 266 stars in the 3 10000 million year age range at heliocentric distances between 8 and 200 parsecs and with spectral types between f5 k5 a sub sample of 101 stars between 3 500 million years old were observed in deep exposures with a coronagraph to search for faint sub stellar companions a total of 288 candidate companions were discovered around the sample stars which were re imaged at subsequent epochs to determine physical association with the candidate host stars by checking for common proper motion benefitting from a highly accurate astrometric calibration of the observations we were able to successfully apply the common proper motion test in the majority of the cases including stars with proper motions as small as 20 milli arcseconds year the results from the survey include the discovery of three new brown dwarf companions hd 49197b hd 203030b and scopms 214b 43 new stellar binaries and a triple system the physical association of an additional a priori suspected candidate sub stellar companion to the star hii 1348 is astrometrically confirmed the newly discovered and confirmed young brown dwarf companions span a range of spectral types between m5 and t0 5 and will be of prime significance for constraining evolutionary models of young brown dwarfs and extra solar planets based on the 3 new detections of sub stellar companions in the 101 star sub sample and following a careful estimate of the survey incompleteness a bayesian statistical analysis shows that the frequency of 0 012 0 072 solar mass brown dwarfs in 30 1600 au orbits around young solar analogs is $6.8 \pm 4.9 \pm 8.3 \pm 2$ sigma limits while this is a factor of 3 lower than the frequency of stellar companions to g dwarfs in the same orbital range it is significantly higher than the frequency of brown dwarfs in 0 3 au orbits discovered through precision radial velocity surveys it is also fully consistent with the observed frequency of 0 3 au extra solar planets thus the result demonstrates that the radial velocity brown dwarf desert does not extend to wide separations contrary to previous belief
