jeenderby at the last nato asi on liquids held in corsica august 1977 professor de gennes in his summary of that meeting suggested that the next asi should concentrate on some specific aspect of the subject and mentioned explicitly ionic solutions as one possibility the challenge was taken up by marie claire bellissent funel and george neilson i am sure that all the participants would wish to congratulate our two colleagues

for putting together an outstanding programme of lectures round tables and poster session the theory which underlies the subject was covered by four leading authorities j p hansen paris set out the general framework in terms of the statistical mechanics of bulk and surface properties h l friedman stony brook focused attention on ionic liquids at equilibrium and j b hubbard considered non equilibrium properties such as the electrical conductivity and ionic friction coefficients finally the basic theory of polyelectrolytes treated as charged linear polymers in aqueous solution was presented by j m victor paris

there are essentially two theories of solutions that can be considered exact the mcmillan mayer theory and fluctuation solution theory fst the first is mostly limited to solutes at low concentrations while fst has no such issue it is an exact theory that can be applied to any stable solution regardless of the number of components and their co

the encyclopedia of physical chemistry and chemical physics introduces possibly unfamiliar areas explains important experimental and computational techniques and describes modern endeavors the encyclopedia quickly provides the basics defines the scope of each subdiscipline and indicates where to go for a more complete and detailed explanation particular attention has been paid to symbols and abbreviations to make this a user friendly encyclopedia care has been taken to ensure that the reading level is suitable for the trained chemist or physicist the encyclopedia is divided in three major sections fundamentals the mechanics of atoms and molecules and their interactions the macroscopic and statistical description of systems at equilibrium and the basic ways of treating reacting systems the contributions in this section assume a somewhat less sophisticated audience than the two subsequent sections at least a portion of each article inevitably covers material that might also be found in a modern undergraduate physical chemistry text methods the instrumentation and fundamental theory employed in the major spectroscopic techniques the experimental means for characterizing materials the instrumentation and basic theory employed in the study of chemical

kinetics and the computational techniques used to predict the static and dynamic properties of materials applications specific topics of current interest and intensive research for the practicing physicist or chemist this encyclopedia is the place to start when confronted with a new problem or when the techniques of an unfamiliar area might be exploited for a graduate student in chemistry or physics the encyclopedia gives a synopsis of the basics and an overview of the range of activities in which physical principles are applied to chemical problems it will lead any of these groups to the salient points of a new field as rapidly as possible and gives pointers as to where to read about the topic in more detail
