this text aims to unify and inter relate mathematical topics and explain how to design run and analyse better algorithms many of the less common algorithms are included i.e planarity graph colouring minimization of machine states these are actually run so that students can see the importance of working through each step of an algorithm by hand topics are chosen for their contribution to the students ability to reason abstractly for example matrices introduces the topic from the study of arrays disjunctive forms does not rely on the typical karnaugh maps and quine mcclusky algorithm to find the minimal forms of any given proposition and planarity presents a complete planarity algorithm allowing the student to master a tough interesting procedure logic and proof are explained through example and technicalities and limitations of realcomputer languages are avoided topics are set in some historical framework whenever possible within the overall studies from which they are derived

this text introduces students to basic techniques of writing proofs and acquaints them with some fundamental ideas the authors assume that students using this text have already taken courses in which they developed the skill of using results and arguments that others have conceived this text picks up where the others left off it develops the students ability to think mathematically

and to distinguish mathematical thinking from wishful thinking

mainly for math and engineering majors clear concise writing style is student oriented j graded problem sets with many diverse problems range from drill to more challenging problems this course follows the three semester calculus sequence at two and four year schools

features an early introduction of relations functions and their inverses emphasizes domain range symmetry roots graphs notation and algebra of functions throughout a variety of exercises with real world applications from business geology archeology and psychology a strong emphasis on geometry throughout in keeping with the mctm and amatyc standards

this book is an outgrowth of 15 years of teaching experience in a course on boundary value problems it is intended to introduce junior and senior students to boundary value problems with special emphasis on the modeling process that leads to partial differential equations

this second edition of the text has been reorganized to make it even more easy to use for students among the various improvements there is more geometric interpretation and more emphasis on differential equations

this text is an introduction to topology and homotopy topics are integrated into a coherent whole and developed slowly so students will not be overwhelmed

gives an introduction to the modern approximation techniques and explains how why and when the techniques can be expected to work the authors focus on building students intuition to help them understand why the techniques presented work in general and why in some situations they fail with a wealth of examples and exercises the text demonstrates the relevance of numerical analysis to a variety of disciplines and provides ample practice for students the applications chosen demonstrate concisely how numerical methods can be and often must be applied in real life situations
