this book differs from traditional numerical analysis texts in that it focuses on the motivation and ideas behind the algorithms presented rather than on detailed analyses of them it presents a broad overview of methods and software for solving mathematical problems arising in computational modeling and data analysis including proper problem formulation selection of effective solution algorithms and interpretation of results in the 20 years since its original publication the modern fundamental perspective of this book has aged well and it continues to be used in the classroom this classics edition has been updated to include pointers to python software and the chebfun package expansions on barycentric formulation for lagrange polynomial interpretation and stochastic methods and the availability of about 100 interactive educational modules that dynamically illustrate the concepts and algorithms in the book scientific computing an introductory survey second edition is intended as both a textbook and a reference for computationally oriented disciplines that need to solve mathematical problems

the text presents and discusses some of the most influential papers in matrix computation authored by gene h golub one of the founding fathers of the field the collection of 21 papers is divided into five main areas iterative methods for linear systems solution of least squares problems matrix factorizations and applications orthogonal polynomials and quadrature and eigenvalue problems commentaries for each area are provided by leading experts anne greenbaum ake bjorck nicholas higham walter gautschi and g w pete stewart comments on each paper are also included by the original authors providing the reader with historical information on how the paper came to be written and under what circumstances the collaboration was undertaken including a brief biography and facsimiles of the original papers this text will be of great interest to students and researchers in numerical analysis and scientific computation
