it is a pleasure and an honor to be able to present this collection of papers to ray reiter on the occasion of his 60th birthday to say that ray s research has had a deep impact on the field of artificial intel ligence is a considerable understatement better to say that anyone thinking of do ing work in areas like deductive databases default reasoning diagnosis reasoning about action and others should realize that they are likely to end up proving corollaries to ray s theorems sometimes studying related work makes us

think harder about the way we approach a problem studying ray's work is as likely to make us want to drop our way of doing things and take up his. This is because more than a mere visionary ray has always been a true leader. He shows us how to proceed not by pointing from his armchair but by blazing a trail himself setting up camp and waiting for the rest of us to arrive. The international joint conference on artificial intelligence clearly recognized this and awarded ray its highest honor the research excellence award in 1993 before it had even finished acknowledging all the founders of the field. The papers collected here sample from many of the areas where ray has done pioneering work. One of his earliest areas of application was databases and this is reflected in the chapters by Bertossi et al and the survey chapter by Minker.

Conceptual models are descriptions of our ideas about a problem used to shape the implementation of a solution to it. Everyone who builds complex information systems uses such models be they requirements analysts knowledge modellers or software designers but understanding of the pragmatics of model design tends to be informal and parochial. Lightweight uses of logic can add precision without destroying the intuitions we use to interpret our descriptions. Computing with logic allows us to make use of this precision in providing automated support tools. Modern information scientists need to know what these methods are for and may need to build their own. This book gives you a place to begin. Where do you start when building models in a precise language like logic? One way is by following standard paradigms for design and adapting these to your needs. Some of these come from an analysis of existing informal notations others are from within logic itself. We take you through a sample of these from more commonplace styles of formal modelling to non standard methods such as techniques editing and argumentation. Each of these provides a window onto broader areas of applied logic and gives you a basis for adapting the method to your own needs.
