published in 1992 like the first this second edition is not intended as introductory textbook command driven boolean searching it is targeted at online searchers who already have some knowledge of command languages and may be proficient searchers on databases in one or two subject areas but when required to venture into new and less familiar territory still need guidance it is also offered to end users who possess the subject expertise but lack of information retrieval know how the manual is offered as a guide to database selection and a navigational aid through the twists and turns of the retrieval maze at least some of the dead ends and backtracking may thereby be avoided this volume written by experts in their various fields deals with the subject coverage and record structures of

specific databases offers comparisons between databases context indexing procedures updating policies etc discusses the choice between online and cd rom sources and between hosts if online is selected and illustrates strategies with numerous search extracts

bacteriologists from all levels of expertise and within all specialties rely on this manual as one of the most comprehensive and authoritative works since publication of the first edition of the systematics the field has undergone revolutionary changes leading to a phylogenetic classification of prokaryotes based on sequencing of the small ribosomal subunit the list of validly named species has more than doubled since publication of the first edition and descriptions of over 2000 new and realigned species are included in this new edition along with more in depth ecological information about individual taxa and extensive introductory essays by leading authorities in the field

whereas the cerebral specialization for skilled manual actions praxis seems closely linked to dominance for language with both functions left lateralized in the vast majority of humans the neural correlates of hand preference are still less well understood indeed as a combination of inherited and non inherited genomic factors i e direct parental and concealed environmental contributions handedness in contrast to language is less likely to have strong genetic indices and clearly lateralized functional organization what about eye dominance unimanual and bimanual object manipulation and gestures or attentional systems and the related egocentric or allocentric coding of space are these different categories functionally and structurally interconnected is their development and contribution to task performance linked even if they are differently lateralized how are they connected to language learning or its

development in trying to understand these relationships and their neural underpinnings we obtain a new insight into fundamental human behaviors which depend either on shared or distinct cerebral resources that must nevertheless be harmonized by higher order cerebral processing in this research topic we assembled a dozen of original research contributions as well as articles with more theoretically driven perspectives that directly speak to these issues hopefully this work will serve as a foundation for further discussions and will stimulate new research in this fascinating domain

contains worked solutions to all of the exercises in the text for instructors only
