this book is an introduction to manifolds at the beginning graduate level it contains the essential topological ideas that are needed for the further study of manifolds particularly in the context of differential geometry algebraic topology and related fields its guiding philosophy is to develop these ideas rigorously but economically with minimal prerequisites and plenty of geometric intuition here at the university of washington for example this text is used for the first third of a year long course on the geometry and topology of manifolds the remaining two thirds focuses on smooth manifolds there are many superb texts on general and algebraic topology available why add another one to the catalog the answer lies in my particular vision of graduate education it is my admittedly biased belief that every serious student of mathematics needs to know manifolds intimately in the same way that most students come to know the integers the real numbers euclidean spaces groups rings and fields manifolds play a role in nearly every major branch of

mathematics as I illustrate in chapter 1 and specialists in many fields find themselves using concepts and terminology from topology and manifold theory on a daily basis. Manifolds are thus part of the basic vocabulary of mathematics and need to be part of the basic graduate education. The first steps must be topological and are embodied in this book. In most cases they should be complemented by material on smooth manifolds, vector fields, differential forms and the like. After all, few of the really interesting applications of manifold theory are possible without using tools from calculus.

This book is about the interplay between algebraic topology and the theory of infinite discrete groups. It is a hugely important contribution to the field of topological and geometric group theory and is bound to become a standard reference in the field. To keep the length reasonable and the focus clear the author assumes the reader knows or can easily learn the necessary algebra but wants to see the topology done in detail. The central subject of the book is the theory of ends. Here the author adopts a new algebraic approach which is geometric in spirit.

This book presents a comprehensive account of the theory of spaces of continuous functions under uniform, fine and graph topologies. Besides giving full details of known results an attempt is made to give generalizations wherever possible enriching the existing literature. The goal of this monograph is to provide an extensive study of the uniform, fine and graph topologies on the space $C(X, Y)$ of all continuous functions from a Tychonoff space X to a metric space Y and the uniform and fine topologies on the space $H(X, Y)$ of all self homeomorphisms on a metric space X . The subject matter of this monograph is significant from the theoretical viewpoint but also has applications in areas such as analysis, approximation theory and differential topology. Written in an accessible style this book will be of interest to researchers as well as graduate students in this vibrant research area.

Essentials of Mathematics is designed as both a textbook and outside reading for college students who want to prepare themselves for mathematics courses beyond the first year level and take courses in which proofs play a major role. There are also narratives on the nature of mathematics and the mathematics profession.

Includes articles as well as notes and other features about mathematics and the profession.

Abstract: Given a subspace X , a subset R (superscript d) and a finite set S (subset R (superscript d)) we introduce the Delaunay simplicial complex d (subscript X) restricted by X . Its simplices are spanned by subsets T (subset S) for which the common intersection of Voronoi cells meets X in a non empty set. By the Nerve Theorem $\bigcup d$ (subscript X) and X are homotopy equivalent if all such sets are contractible. This paper shows that $\bigcup d$ (subscript X) and X are homeomorphic if the sets can be further subdivided in a certain way so they form a regular CW complex.

Presents an epistemological inquiry of social scientific phenomenology premised solely on the oneness of God. This book shows how the Qur'an associates this cardinal principle of divine oneness with the episteme of unity of knowledge.

for a senior undergraduate or first year graduate level course in introduction to topology appropriate for a one semester course on both general and algebraic topology or separate courses treating each topic separately this text is designed to provide instructors with a convenient single text resource for bridging between general and algebraic topology courses two separate distinct sections one on general point set topology the other on algebraic topology are each suitable for a one semester course and are based around the same set of basic core topics optional independent topics and applications can be studied and developed in depth depending on course needs and preferences
