environmental economics has established itself as one of its field's most authoritative texts as well as one of the more challenging. It distinguishes itself from other books by presupposing that readers already have an understanding of intermediate microeconomics. Thus, this book concentrates only on environmental economics problems of pollution of earth, air, and water, with an emphasis on regulation and private sector anti-pollution incentives and coverage of international examples.

The book includes the author's most important work on a variety of topics, including the Hotelling model of spatial competition as applied to resource economics, jurisdictional tax competition, particularly in the context of resource taxes and environmental regulation, both theoretical and empirical.

Many of the frontiers of environmental economics research are at the interface of large-scale and long-term environmental change with national and global economic systems. This is also where some of the most challenging environmental policy issues occur. Volume 3 of the Handbook of Environmental Economics provides a synthesis of the latest theory on economy-wide and international environmental issues and a critical review of models for analyzing those issues. It begins with chapters on the fundamental relationships that connect environmental resources to economic growth and long-run social welfare. The following chapters consider how environmental policy differs in a general equilibrium setting from a partial equilibrium setting and in a distorted economy from a perfect economy. The volume closes with chapters on environmental issues that cross or transcend national borders, such as trade and the environment, biodiversity, conservation, acid rain, ozone depletion, and global climate change. The volume provides a useful reference for not only natural resource and environmental economists but also international economists, development economists, and macroeconomists.

Over the last decade, market-based incentives have become the regulatory tool of choice when trying to solve difficult environmental problems. Evidence of their dominance can be seen in recent proposals for addressing global warming through an emissions trading scheme in the Kyoto Protocol and for amending the Clean Air Act to add a new emissions trading system for smog precursors and mercury. The Bush Administration's Clear Skies program is widely viewed as more efficient than traditional command-and-control regulation. This collection of essays takes a critical look at this question and evaluates whether the promises of market-based regulation have been fulfilled. Contributors put forth the ideas that few regulatory instruments are actually purely market-based or purely

prescriptive and that both approaches can be systematically undermined by insufficiently careful design and by failures of monitoring and enforcement all in all the essays recommend future research that no longer pits one kind of approach against the other but instead examines their interaction and compatibility this book should appeal to academics in environmental economics and law along with policymakers in government agencies and advocates in non governmental organizations

besides covering the paradigmatic bases of environmental ecological and natural resource economics this book discusses the economic dimensions of and approaches to pollution environmental and ecosystem management biodiversity global warming energy and resource use and sustainable development
