this thesis focuses on the medium access control mac layer many mac protocols for wireless
 networks proposed or implemented to date are based on collision avoidance handshakes
 between sender and receiver the key objective of collision avoidance handshakes is reducing or
 eliminating the collision of data packets from a source at any given receiver due to interference
 from packets from other sources in the vast majority of these protocols including the ieee 802
 11 standard the handshake is sender initiated in that the sender asks the receiver for permission
 to transmit using a short control packet and transmits only after the receiver sends a short clear
 to send notification there are two main objectives in this work analyze the effect of reversing
 the collision avoidance handshake as a way to improve the performance of mac protocols under
 any conditions in the network and design mac protocols that provide correct floor acquisition
 without carrier sensing or code pre assignment we show that receiver initiated collision
 avoidance mac protocols not only outperform any sender initiated ones but also guarantee
 collision free data transmission and seamless support for mobility by using simple low cost
