this book aims to give the non specialist reader a general overview of what physicists think they do and do not know in some representative frontier areas of contemporary physics it focuses on the fundamental problems at the heart of the subject and emphasizes the provisional nature of our present understanding of things

aimed at helping the physics student to develop a solid grasp of basic graduate level material this book presents worked solutions to a wide range of informative problems these problems have been culled from the preliminary and general examinations created by the physics department at princeton university for its graduate program the authors all students who have successfully completed the examinations selected these problems on the basis of usefulness interest and originality and have provided highly detailed solutions to each one their book will be a valuable resource not only to other students but to college physics teachers as well the first four chapters pose problems in the areas of mechanics electricity and magnetism quantum mechanics and

thermodynamics and statistical mechanics thereby serving as a review of material typically covered in undergraduate courses later chapters deal with material new to most first year graduate students challenging them on such topics as condensed matter relativity and astrophysics nuclear physics elementary particles and atomic and general physics

this text features 182 challenging problems with detailed solutions textbook references clear illustrations and an easy to use layout

in the study of physics at the 2 stage and the 1st year engineering course problem solving poses a major challenge this book aims at assisting the students approach a physics problem elaborating on what signifies that a solution has been found and much more tougher problems have been solved laying great stress on approach and method while simultaneously offering the number of ways a given problem can be solved applying different approaches the fourth edition of this widely used text presents 300 new problems with answers including 50 fully solved examples

there are some unanswered questions in modern physics that modern physics does not have answers for that it is due to the inability of theories some physicists believe that by combining general relativity and quantum mechanics these problems may be resolved and the unanswered questions will be answered in all of these efforts the classical physic has been ignored while nature is unique and all physical phenomena from the microscopic or the macroscopic ones are obeying the same law therefore to solve the contemporary physics problems in this book from a new approach the basic concepts and relations of modern physics are reviewed and analyzed then three contemporary theories which combine constructs from several different theoretical perspectives are described to show how classical mechanics relativity and quantum mechanics can be combined coherently

people have always wanted answers to the big questions where did we come from how did the universe begin what is the meaning and design behind it all is there anyone out there the creation accounts of the past now seem less relevant and credible they have been replaced by a variety of what can only be called superstitions ranging from new age to star trek but real

science can be far stranger than science fiction and much more satisfying i am a scientist and a scientist with a deep fascination with physics cosmology the universe and the future of humanity i was brought up by my parents to have an unwavering curiosity and like my father to research and try to answer the many questions that science asks us i have spent my life travelling across the universe inside my mind through theoretical physics i have sought to answer some of the great questions at one point i thought i would see the end of physics as we know it but now i think the wonder of discovery will continue long after i am gone we are close to some of these answers but we are not there yet the problem is most people believe that real science is too difficult and complicated for them to understand but i don't think this is the case to do research on the fundamental laws that govern the universe would require a commitment of time that most people don't have the world would soon grind to a halt if we all tried to do theoretical physics but most people can understand and appreciate the basic ideas if they are presented in a clear way with equations which i believe is possible and which is something i have enjoyed trying to do throughout my life i want to add my voice to those who demand why we must ask the big questions immediate action on the key challenges for our global community i hope that going forward even when i am no longer here people with power can show creativity courage and leadership let them rise to the challenges and act now
