dna nanoscience from prebiotic origins to emerging nanotechnology melds two
tales of dna one is a look at the first 35 years of dna nanotechnology to better
appreciate what lies ahead in this emerging field the other story looks back 4
billion years to the possible origins of dna which are shrouded in mystery the
book is divided into three parts comprised of 15 chapters and two brief
interludes part i includes subjects underpinning the book such as a primer on
dna the broader discipline of nanoscience and experimental tools used by the
principals in the narrative part ii examines the field of structural dna
nanotechnology founded by biochemist crystallographer nadrian seeman that
uses dna as a construction material for nanoscale structures and devices rather
than as a genetic material part iii looks at the work of physicists noel clark and
tommaso bellini who found that short dna nanodna forms liquid crystals that act
as a structural gatekeeper orchestrating a series of self assembly processes
using nanodna this led to an explanation of the polymeric structure of dna and of
how life may have emerged from the prebiotic clutter
