the aim of the present monograph is two fold a to give a short account of the main results concerning the theory of random systems with complete connections and b to describe the general learning model by means of random

systems with complete connections the notion of chain with complete connections has been introduced in probability theory by onicescu and mihoc 1935a these authors have set themselves the aim to define a very broad type of dependence which takes into account the whole history of the evolution and thus includes as a special case the markovian one in a sequel of papers of the period 1935 1937 onicescu and mihoc developed the theory of these chains for the homogeneous case with a finite set of states from differ ent points of view ergodic behaviour associated chain limit laws these results led to a chapter devoted to these chains inserted by oni cescu and mihoc in their monograph published in 1937 important contributions to the theory of chains with complete connections are due to doeblin and fortet and refer to the period 1937 1940 they consist in the approach of chains with an infinite history the so called chains of infinite order and in the use of methods from functional analysis
