as a student i discovered in our library a thin booklet by frederick mosteller entitled 50 challenging problems in probability it referred to as a elementary regular textbook by william feller an introduction to probability theory and its applications so i took this one along too and started on the first of mosteller's problems on the train riding home from that evening i caught on to probability these two books were not primarily about abstract formalisms but rather about basic modeling ideas and about ways often extremely elegant ones to apply those notions to a surprising variety of empirical phenomena essentially these books taught the reader the skill to think probabilistically and to apply simple probability models to real world problems the present book is in this tradition it is based on the view that those cognitive skills are best acquired by solving challenging nonstandard probability problems my own experience both in learning and in teaching is that challenging problems often help to develop and to sharpen our probabilistic intuition much better than plain style deductions from abstract

concepts
