this book explores the main assumptions upon which behavioural science theories are based offers alternatives and challenges the reader to serious critical thought

behavioral science in the wild helps practitioners understand how to use insights from the behavioral sciences to create change in the real world

there are sharp differences among psychologists sociologists philosophers and others concerned with the behavioural and social sciences not simply about the adequacy of particular explanatory systems but about the very forms of explanation appropriate in this field the editors have therefore invited a number of distinguished contributors to bring their views into direct confrontation each chapter takes the form of an exposition a comment and a final reply by the first author this volume was first published in 1970

in arguably the finest text ever written in the philosophy of social science abraham kaplan emphasizes what unites the behavioral sciences more than what distinguishes them from one another kaplan avoids the bitter disputes among people doing methodology claiming instead that what is important are those qualities intrinsic to the overall aspirations of the social sciences he deals with special problems of various disciplines only so far as may be helpful in clarifying the general method of inquiry the conduct of inquiry is a systematic rounded and wide ranging inquiry into behavioral science kaplan is guided by the experience of sciences with longer histories but he is bound neither to their problems nor to their solutions instead he addresses the methodology of behavioral science in the broad

sense of both method and science the work is not a formal exercise in the philosophy of science but rather a critical and constructive assessment of the developing standards and strategies of contemporary social inquiry he emphasizes the tasks achievements limitations and dilemmas of the newer disciplines philosophers of science usually choose to write about the most fully developed sciences because problems are clearer there the result is ordinarily of little benefit to the behavioral scientist whose task is clarification of method here the precedents and analogies of physical science are obscure or inappropriate the conduct of inquiry goes a long way in drawing upon the strengths of social research insights without simplifying the common concerns of the scientific enterprise as a whole as leonard broom noted when the book initially appeared kaplan fills a gap and does so with admirable clarity and often engaging wit it lacks pomposity pedantry and pretension and it is bound to make an impact on the teaching of and with luck research in the behavioral sciences

students and beginning researchers often discover that their introductory statistics and methods courses have not fully equipped them to plan and execute their own behavioral research studies this indispensable book bridges the gap between coursework and conducting independent research with clarity and wit the author helps the reader build needed skills to formulate a precise meaningful research question understand the pros and cons of widely used research designs and analysis options correctly interpret the outcomes of statistical tests make informed measurement choices for a particular study manage the practical aspects of data screening and preparation and craft effective journal articles oral presentations and posters including annotated examples and recommended readings most chapters feature theoretical and computer based exercises an answer appendix at the back of the book allows readers to check their work

this textbook is designed for all undergraduate students headedfor medical dental veterinary and nursing school as well asbiology majors classical and modern

ethology is discussed in addition to sociobiology and finally the physiology of different behavioral systems attention is paid to the behavior of primates including humans and in some cases mention is made of human clinical syndromes

statistics for the behavioural sciences presents a complete introduction to both descriptive and inferential statistics using an informal conversational approach that explains both why certain statistical methods are used and how certain statistical methods are used and how and when to apply them only a basic background in arithmetic and coordinate geometry is required and an appendix on basic mathematical skills with sample problems and solutions is provided in addition to end of chapter problems a mixed set of review questions is given after every five or six chapters with solutions provided for all problems statistics for the behavioural sciences is a substantially revised version of the authors earlier book

behavioral science in medicine introduces medical students to the science of human behavior organized to mirror the behavioral science psychiatry course taught in the first two years this text effectively teaches the major concepts of this complex subject and prepares students for board exams the second edition is appropriate for courses in behavioral science alone but also for courses that merge behavioral science and neuroscience the increased depth of coverage of psychiatric illness substance abuse and pediatric psychiatry also makes the second edition appropriate for use in clinical psychiatry courses in the third and fourth year

this text uses the same conceptual intuitive approach of basic statistics for the behavioral sciences but eliminates extensive reference material and advanced or obscure statistical methods essentials presents only the procedures undergraduates need for reading research literature and conducting their own studies new terms are integrated with more difficult concepts in an accessible non threatening format that provides concise explanations creating a foundation and making further elaboration easier to understand
