Applied Microbiology - Antibiotics and antimicrobial agents - Food microbiology - Environmental microbiology --- Sample Questions and Their Answers Here, we will explore some typical exam questions along with detailed explanations to help reinforce your understanding. Question 1: What is the primary difference between gram-positive and gram-negative bacteria? Answer: The main difference lies in their cell wall structure. Gram-positive bacteria have a thick peptidoglycan layer that retains the crystal violet stain during Gram staining, appearing purple under the microscope. In contrast, gram-negative bacteria have a thinner peptidoglycan layer and an outer membrane containing lipopolysaccharides, which do not retain the crystal violet stain but take up the counterstain (safranin), appearing pink. Question 2: Describe the process of binary fission in bacteria. Answer: Binary fission is a form of asexual reproduction in bacteria where a single cell divides into two identical daughter cells. The process involves:

Replication of the bacterial chromosome.1. Elongation of the cell to accommodate the duplicated DNA.2. Segregation of the chromosomes to opposite ends of the cell.3. Formation of a septum (division wall) by the inward growth of the cell.4. membrane and wall. Splitting into two separate cells, each with a copy of the original DNA.5. Question 3: Name three methods used for microbial identification in the lab. Answer: Gram staining and microscopy1. Culturing on selective and differential media2. Molecular techniques such as PCR and DNA sequencing3. Question 4: What role do virulence factors play in microbial pathogenicity? Answer: Virulence factors are molecules produced by pathogens that enhance their ability to cause disease. These include toxins, enzymes, surface proteins, and mechanisms for immune evasion. They facilitate attachment to host tissues, invasion, nutrient acquisition, and destruction of host defenses, directly contributing to the severity of infection. Question 5: How does the immune system respond to bacterial infections? Answer: The immune response involves both innate and adaptive components: Innate immunity includes phagocytes (macrophages and neutrophils), complement activation, and inflammation, which provide initial defense. Adaptive immunity involves the activation of lymphocytes (T and B cells), leading to antibody production and cell-mediated responses that specifically target the pathogen. Memory cells formed during adaptive responses result in quicker responses upon re-infection.
