this book is a monograph about the analytical dynamics of nonlinear rotor systems the analytical
solutions of periodic motions in nonlinear rotor systems are presented in this book to help one
understand the analytical solutions the generalized harmonic balance method for periodic motions in
polynomial nonlinear systems is briefly reviewed first and then the semi analytical method for
periodic motions in any nonlinear systems is presented briefly too which is also called the implicit
mapping method such two analytical methods are employed to determine the solutions of periodic
motions in nonlinear rotor systems the analytical expressions of periodic motions to chaos for
nonlinear rotor systems are presented and the frequency amplitude characteristics of nonlinear rotor
systems are discussed in addition the accurate modeling of nonlinear rotors with oil films is
presented and the periodic motions of such fully nonlinear oil film rotor systems are developed
through the semi analytical method this book provides a better understanding of frequency
amplitude characteristics in nonlinear rotor systems the methodology presented in this book can
help one study complicated nonlinear rotor systems

adequate mathematical modeling is the key to success for many real world projects in engineering
medicine and other applied areas as soon as an appropriate mathematical model is developed it can
be comprehensively analyzed by a broad spectrum of available mathematical methods for example
compartmental models are widely used in mathematical epidemiology to describe the dynamics of
infectious diseases and in mathematical models of population genetics while the existence of an
optimal solution under certain condition can be often proved rigorously this does not always mean
that such a solution is easy to implement in practice finding a reasonable approximation can in
itself be a challenging research problem this research topic is devoted to modeling analysis and
approximation problems whose solutions exploit and explore the theory of partial differential
equations it aims to highlight new analytical tools for use in the modeling of problems arising in
applied sciences and practical areas researchers are invited to submit articles that investigate the
qualitative behavior of weak solutions removability conditions for singularities the dependence of the
local asymptotic property of these solutions on initial and boundary data and also the existence of
solutions contributors are particularly encouraged to focus on anisotropic models analyzing the
preconditions on the strength of the anisotropy and comparing the analytical estimates for the
growth behavior of the solutions near the singularities with the observed growth in numerical
simulations the qualitative analysis and analytical results should be confirmed by the numerically

observed solution behavior
