evolution is defined as the change in the heritable characteristics of biological populations over successive generations resulting in changes in both the genotype and phenotype the evidence for evolution is primarily circumstantial being based on fossils of extinct species physical similarities and a largely common genome charles darwin believed that all species of organisms arise and develop through the natural selection of small inherited variations that increase the individual's ability to compete survive and reproduce today we know so much more than darwin did 150 years ago leading many scientists to discard genetic mutation and natural selection as having the development power previously ascribed to them what has been missing in the science so far is systems thinking a holistic approach to analysis that focuses on the way that a system's constituent parts interrelate and how systems work over time and within the context of larger systems questioning whether the mind consists of organs of the brain an emergent property of the brain or activities of the brain as scientists suggest the author has concluded for none of these the brain being physical it can only deal with the physical but the mind deals in the conceptual which has no physical properties with his background in related technologies the author has compared the human nervous system with telemetry systems as used in modern aircraft vehicles and other applications though implemented differently the functional requirements remain the same which has prompted a different perspective on how it could have evolved the telemetry system in the human body is astounding in its complexity accuracy and reliability leading to the author's doubts as to its claimed evolutionary origins crossing a chasm is an analysis of the probability that such could be accomplished by innumerable unguided small steps over whatever time
