data driven analysis and modeling of turbulent flows provides an integrated treatment of modern data driven methods to describe control and predict turbulent flows through the lens of both physics and data science the book is organized into three parts exploration of techniques for discovering coherent structures within turbulent flows introducing advanced decomposition methods methods for estimation and control using data assimilation and machine learning approaches finally novel modeling techniques that combine physical insights with machine learning this book is intended for students researchers and practitioners in fluid mechanics though readers from related fields such as applied mathematics computational science and machine learning will find it also of interest exploration of techniques for discovering coherent structures within turbulent flows introducing advanced decomposition methods methods for estimation and control using data assimilation and machine learning approaches finally novel modeling techniques that combine physical insights with machine learning

this book offers a complete introduction and overview to the basics and fundamentals of computational methods that have been developed in physics at the undergraduate and upper division levels it details how to make a physical problem computable and tractable with a computer through the use of numerous examples and solved problems ranging from classical mechanics thermodynamics and molecular dynamics to quantum mechanics random processes and more the book directly teaches the reader how to implement these techniques within a physical problem

problems after each chapter

dealing mainly with collisions of electrons and photons with heavy particles atomic collisions discusses electron electron and photon electron collisions the energy range covered extends from a few meV up to a few MeV excluding collisions in which nuclear forces are important emphasis is on the mechanisms by which the various collisions take place almost all of the scattering approximations used in atomic collision theory are considered topics covered include scattering resonances coincidence measurements merged beam experiments positron collisions collisions between spin polarized particles GaAs polarized electron sources position sensitive detection synchrotron radiation sources

cyclotron resonance masers laser cooling and trapping multiphoton processes and more the exposition is relatively self contained and includes end of chapter notes and more than 200 problems

this invaluable book provides a broad introduction to a rapidly growing area of nonequilibrium statistical physics the first part of the book complements the classical book on the langevin and fokker planck equations b risken the fokker planck equation methods of solution and applications springer 1996 some topics and methods of solutions are presented and discussed in details which are not described in risken s book such as the method of similarity solution the method of characteristics transformation of diffusion processes into the wiener process in different prescriptions harmonic noise and relativistic brownian motion connection between the langevin equation and tsallis distribution is also discussed due to the growing interest in the research on the generalized langevin equations several of them are presented they are described with some details recent research on the integro differential fokker planck equation derived from the continuous time random walk model shows that the topic has several aspects to be explored this equation is worked analytically for the linear force and the generic waiting time probability distribution function moreover generalized klein kramers equations are also presented and discussed they have the potential to be applied to natural systems such as biological systems
