fifty years ago a new approach to reaction kinetics began to emerge one based on mathematical models of reaction kinetics or formal reaction kinetics since then there has been a rapid and accelerated development in both deterministic and stochastic kinetics primarily because mathematicians studying differential equations and algebraic geometry have taken an interest in the nonlinear differential equations of kinetics which are relatively simple yet capable of depicting complex behavior such as oscillation chaos and pattern formation the development of stochastic models was triggered by the fact that novel methods made it possible to measure molecules individually now it is high time to make the results of the last half century available to a larger audience students of chemistry chemical engineering and biochemistry not to mention applied mathematics based on recent papers this book presents the most important concepts and results together with a wealth of solved exercises the book is accompanied by the authors mathematica package reactionkinetics which helps both students and scholars in their everyday work and which can be downloaded from extras.springer.com and also from the authors websites further the large set of unsolved problems provided may serve as a springboard for individual research

computational spectroscopy and computational quantum chemical dynamics is a vast field in physical chemistry significant part of this field is developed based on the concepts of time dependent quantum mechanics and its numerical implementations this book gives an introduction to the time dependent quantum chemistry for use with any introductory college university course in optics spectroscopy kinetics dynamics or experimental physical chemistry or chemical physics of the kind usually taken by undergraduate and graduate students in physical chemistry in this book different concepts of time dependent quantum mechanics are systematically presented by first giving emphasis on the contrasting viewpoint of classical and quantum mechanical motion of a particle then by demonstrating the ways to find classical flavour in quantum dynamics thereafter by formally defining the wavepacket which represents a quantum particle and finally by demonstrating numerical methods to explore the wavepacket dynamics in one dimension along with the analytical theory accompanying python chapters in this

book take readers to a hands on tour with python programming by first giving them a quick introduction to the python programming then by introducing the position space grid representation of the wavefunction thereafter by making them familiarized with the fourier transform to represent the discretized wavefunction in momentum space subsequently by showing the python based methodologies to express hamiltonian operator in matrix form and finally by demonstrating the entire python program which solves the wavepacket dynamics in one dimension under influence of time independent hamiltonian following split operator approach rigorous class testing of the presented lecture notes at the indian institute of science gitam university and at nptel platform reveals that physical chemistry students after thoroughly going through all chapters not only develop an in depth understanding of the wavepacket dynamics and its numerical implementations but also start successfully writing their own python code for solving any one dimensional wavepacket dynamics problem

presently it is often assumed that at least in principle robots and social robots in particular have the potential to increase human well being across a wide range of sectors and application areas at the same time efforts to introduce such systems into our everyday environments have had only limited success and it is yet to be seen whether the impact of social robots on our daily lives professional and private will actually be beneficial therefore there is a need to systematically address and study the long term use and presence of social robots in everyday environments where humans not only interact with robots but also have them integrated into the totality of their lived experiences in everyday life one of the main ways to investigate human engagement with social robots in everyday environments is through hri studies conducted in the wild while such an approach has certainly been instrumental to and is increasingly used in hri research we propose here to further expand the underlying theoretical and methodological frameworks to address the notion of everyday life the latter is viewed here as a useful concept and an umbrella term that allows us to address not only specific application domains for robots but also the continuity and totality of human lived experiences that emerge through long term engagement with social robots in everyday life contexts placing social robots in everyday settings has often been an explicit goal for robot development however the notion of everyday life has yet to be systematically analysed and addressed in this context therefore this research topic aims to bring together a wide range of disciplinary and interdisciplinary contributions to further develop the hri domain
