the reported research is concerned with the effects of success and failure upon problem solving although a considerable number of studies dealing with the effects of stress anxiety fear and failure upon learning retention and perception have appeared little has been done to determine in what ways these variables influence the problem solving process a study was undertaken in order to fill this gap in the understanding of problem solving an aspect of human behavior in which psychologists are exhibiting increasing interest author

the purpose of the present book is to solve initial value problems in classes of generalized analytic functions as well as to explain the functional analytic background material in detail from the point of view of the theory of partial differential equations the book is intended to generalize the classical Cauchy-Kovalevskaya theorem whereas the functional analytic background connected with the method of successive approximations and the contraction mapping principle leads to the concept of so called scales of Banach spaces 1 the method of successive approximations allows to solve the initial value problem $u'(t) = f(t, u(t))$ where $u(t)$ is real or vector valued it is well known that this method is also applicable if the function u belongs to a Banach space a completely new situation arises if the right hand side $f(t, u)$ of the differential equation (0.1) depends on a certain derivative u' of the sought function i.e. the differential equation (0.1) is replaced by the more general differential equation $u'(t) = f(t, u(t), u'(t))$ there are differential equations of type (0.3) with smooth right hand sides not possessing any solution to say nothing about the solvability of the initial value problem (0.3) (0.2) assume for instance that the unknown function denoted by w is complex valued and depends not only on the real variable t that can be interpreted as time but also on spacelike variables x and y then the differential equation (0
