this is an introductory level textbook for partial differential equations pdes it is suitable for a one semester undergraduate level or two semester graduate level course in pdes or applied mathematics this volume is application

oriented and rich in examples going through these examples the reader is able to easily grasp the basics of pdes chapters one to five are organized to aid understanding of the basic pdes they include the first order equations and the three fundamental second order equations i e the heat wave and laplace equations through these equations we learn the types of problems how we pose the problems and the methods of solutions such as the separation of variables and the method of characteristics the modeling aspects are explained as well the methods introduced in earlier chapters are developed further in chapters six to twelve they include the fourier series the fourier and the laplace transforms and the green s functions equations in higher dimensions are also discussed in detail in this second edition a new chapter is added and numerous improvements have been made including the reorganization of some chapters extensions of nonlinear equations treated in earlier chapters are also discussed partial differential equations are becoming a core subject in engineering and the sciences this textbook will greatly benefit those studying in these subjects by covering basic and advanced topics in pdes based on applications

this volume is concerned with the control and dynamics of time delay systems a research field with at least six decade long history that has been very active especially in the past two decades in parallel to the new challenges emerging from engineering physics mathematics and economics the volume covers several new directions including topology induced stability large scale interconnected systems roles of networks in stability and new trends in predictor based control and consensus dynamics the associated applications problems are described by highly complex models and require solving inverse problems as well as the development of new theories mathematical tools numerically tractable

algorithms for real time control the volume which is targeted to present these developments in this rapidly evolving field captures a careful selection of the most recent papers contributed by experts and collected under five parts i methodology from retarded to neutral continuous delay models ii systems signals and applications iii numerical methods iv predictor based control and compensation and v networked control systems and multi agent systems
