does the inheritance of acquired characteristics play a significant role in evolution in this book eva jablonka and marion j lamb attempt to answer that question with an

original provocative exploration of the nature and origin of hereditary variations starting with a historical account of lamarck s ideas and the reasons they have fallen in disrepute the authors go on to challenge the prevailing assumption that all heritable variation is random and the result of variation in dna base sequences they also detail recent breakthroughs in our understanding of the molecular mechanisms underlying inheritance including several pathways not envisioned by classical population genetics and argue that these advances need to be more fully incorporated into mainstream evolutionary theory throughout the book offers a new look at the evidence for and against the heritability of environmentally induced changes and addresses timely questions about the importance of non mendelian inheritance a glossary and extensive list of references round out the book urging a reconsideration of the present dna centric view prevalent in the field epigenetic inheritance and evolution will make fascinating and important reading for students and researchers in evolution genetics ecology molecular biology developmental biology and the history and philosophy of science

biology the possible causal role of phenotypic behavior in evolution balancing theory with actual or potential empiricism they provide the first full examination of this topic plotkin's opening chapter outlines the conceptual minefields that the contributors attempt to negotiate what is an adequate theory of evolution what is behavior and is it possible to maintain a distinction between behavior and other attributes of the phenotype is all or only a special subset of behavior both a cause and a consequence of evolution and what do the theoretical issues mean in empirical terms he concludes that any attempt to understand the causal role of behavior in evolution requires a more complicated theoretical structure than that of orthodox neodarwinism a conceptualization of behavior as a distinctive set of phenotypic attributes and the accumulation of more data david l hull northwestern university provides an alternative account of the evolutionary process by developing a hierarchy of replicators interactors lineages to replace the traditional one of genes organisms species robert n brandon duke university also posits hierarchy as an appropriate architecture for the theoretical complexity needed to support an examination of the role of behavior in evolution f j odling smee brunei university outlines a theoretical structure to encompass the behavior of phenotypes concentrating on the unrestricted definition of behavior everything that an animal does the remaining chapters are as much concerned with evidence as with theory plotkin concentrates on a restricted definition of behavior behavior that is a product of choosing intelligence reviewing our empirical knowledge of how learning might influence evolution r i m dunbar university college london uses empirical studies of vertebrate social behavior to deal with the question of how the social systems especially of primates might have a causal role in species evolution a bradford book
