abstract solar energy is a form of renewable energy generated from natural resources that are continuously replenished in malaysia several solar pv schemes are available including feed in tariff fit net energy metering nem and large scale solar lss this project focuses on the nem scheme where energy produced by the installed solar pv system is first used for on site consumption with any surplus exported to tenaga nasional berhad tn timer on a one on one offset basis this mechanism allows consumers to significantly reduce or even eliminate their electricity bills contributing positively to economic savings the implementation of solar pv systems is an effective approach to reducing air pollution making it a sustainable solution for addressing environmental concerns this project is conducted at two locations factory a in johor and factory b in penang involving two case studies the pv system size is determined by comparing the lowest capacity between maximum demand energy consumption and available real estate factory a requires 339 045 kwh per month while factory b s

demand is 465 899 kwh per month however due to space limitations the pv system at factory a cannot fully meet the building s energy demand for factory b the system size is restricted by maximum demand the performance of the pv systems is evaluated by comparing simulation results with actual measurements simulations are conducted using pvsyst software and the results indicate that the installed system performs better than the simulated data suggesting higher than expected energy generation additionally the project analyzes the building s power factor pf before and after solar pv installation by installing grid connected photovoltaic system the solar pv system will supply mostly real power since the inverter pf setting is near to 1 the system only supplies active power to the consumer as a result the active power drawn from the grid decreases slightly based on the consumer s demand while the reactive power remains at its initial value supplied by the grid this situation will result in lower pf looking from the grid before installing the solar pv system factory a had a power factor of 0 97 which decreased to 0 95 after installation similarly factory b s power factor dropped from 0 96 to 0 93 following the solar pv system installation if the pf drops below 0 85 consumers are required to install capacitor banks to compensate for the reactive power demand to maintain the same power factor as before installing solar the factory can add capacitors to their existing capacitor bank the required capacitor sizes for factory a and factory bare 2 210 mf and 6 948 mf respectively
